

Differential Microphone Preamplifier with Internal Bias and Complete Shutdown

General Description

The MAX4063 is a differential-input microphone preamplifier optimized for high-performance, portable applications. The device features two selectable inputs, differential outputs, adjustable gain, an integrated low-noise bias source, and a low-power shutdown mode. Two input paths provide both differential and single-ended microphone sensing. The high-noise rejection of the differential input is ideally suited to an internal microphone where system noise and long-run PC board traces can degrade low-level signals. The single-ended input provides a simple connection to an external microphone.

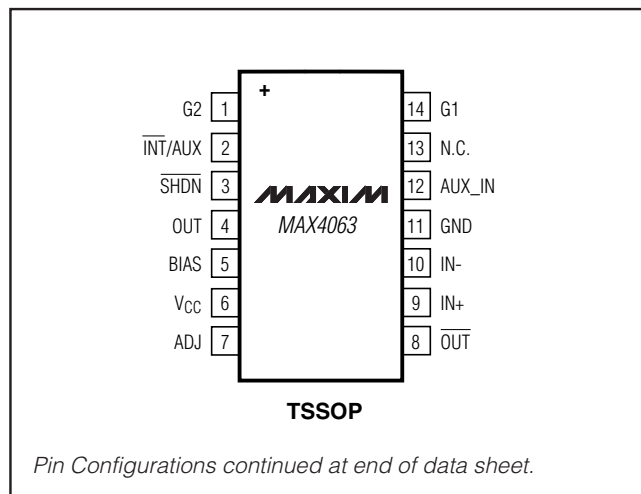

The differential and single-ended inputs have independent, adjustable gains that are set with a single external resistor. Differential outputs provide a full-scale signal of up to 6V_{P-P} from a single 3V supply, optimizing the dynamic range of the amplified signal. A complete shutdown mode reduces the supply current to only 0.3μA and disables the microphone bias for the ultimate in power savings.

The MAX4063 operates from 2.4V to 5.5V and is specified over the extended -40°C to +85°C operating temperature range. The MAX4063 is available in both 16-pin TQFN (4mm x 4mm x 0.8mm) and 14-pin TSSOP packages.

Applications

Notebook Audio Systems
Tablet PCs
PDA Audio Systems
Signal Conditioning

Pin Configurations

Features

- ◆ 2.4V to 5.5V Single-Supply Operation
- ◆ Differential Inputs and Outputs
- ◆ Adjustable Gain
- ◆ High 95dB PSRR
- ◆ High 79dB CMRR
- ◆ Low-Noise, Integrated Microphone Bias
- ◆ 750μA Supply Current
- ◆ 0.3μA Shutdown Current
- ◆ ±4kV ESD Protection (AUX_IN)
- ◆ THD+N: 0.05% at 1kHz
- ◆ Available in Space-Saving Packages
 - 14-Pin TSSOP
 - 16-Pin TQFN (4mm x 4mm x 0.8mm)

Pin Description

PIN		NAME	FUNCTION
TSSOP	TQFN		
1	15	G2	Gain-Selectable Input. Connect an external resistor between G1 and G2 to set the gain for the differential amplifier (see <i>Adjustable Differential Gain-Setting</i> section).
2	16	$\overline{\text{INT/AUX}}$	Internal (Differential) or Auxiliary (Single-Ended) Input Select. Drive $\overline{\text{INT/AUX}}$ low to select differential in or high to select auxiliary in.
3	1	$\overline{\text{SHDN}}$	Shutdown Input. Drive $\overline{\text{SHDN}}$ high for normal operation. Drive $\overline{\text{SHDN}}$ low for shutdown mode.
4	2	OUT	Amplifier Output. OUT is high impedance when in shutdown mode.
5	3	BIAS	External Electret Microphone Capsule Bias Output. Bypass BIAS with a 1 μ F capacitor to ground.
6	4	V _{CC}	Power Supply. Bypass the V _{CC} to GND with a 0.1 μ F capacitor.
7	5	ADJ	Adjustable Gain Select for AUX_IN (see <i>Auxiliary Input-Gain Adjustment</i> section). Connect a 10pF capacitor between OUT and ADJ.
8	7	$\overline{\text{OUT}}$	Complementary Amplifier Output. $\overline{\text{OUT}}$ is high impedance in shutdown mode.
9	9	IN+	Noninverting Differential Amplifier Input. AC-couple the audio signal into IN+.
10	10	IN-	Inverting Differential Amplifier Input. AC-couple the audio signal into IN-.
11	11	GND	Ground
12	12	AUX_IN	Single-Ended Input for Auxiliary Microphone. AC-couple the audio signal into AUX_IN.
13	6, 8, 14	N.C.	No Connection. Not internally connected.
14	13	G1	Gain-Selectable Input. Connect an external resistor between G1 and G2 to set the gain for the differential amplifier.
—	—	EP	Exposed Pad (TQFN Only). Internally connected to GND. Connect to a large ground plane to maximize thermal performance. Not intended as an electrical connection point.

Detailed Description

The MAX4063 is a differential microphone preamplifier providing high-quality amplification, optimized for use in computer and mobile applications. This device features adjustable gain, very high power-supply rejection (95dB), and common-mode rejection (79dB), making it ideal for low-noise applications. The MAX4063 provides a differential input stage, making the device particularly effective when layout constraints force the microphone amplifier to be physically remote from the ECM microphone.

The MAX4063 is capable of switching its output between the differential input and an inverting single-ended input. $\overline{\text{INT/AUX}}$ selects either the differential input or single-ended auxiliary input. In addition, the MAX4063 has an integrated microphone bias source, simplifying system design and eliminating the need for

external components. The MAX4063 has a complementary output allowing CODECs and other devices with differential inputs to be optimally driven (see *Functional Diagram*). The MAX4063 includes a 0.3 μ A shutdown mode for ultimate power savings. The differential gain of the MAX4063 is set with a single resistor connected between the G1 and G2 pins. The MAX4063 has an internal default gain of 20V/V on the AUX_IN input. The AUX_IN gain can be increased with a single external resistor (see the *Differential-Gain Adjustment and Auxiliary Input-Gain Adjustment* sections).

Differential Input

The main microphone amplifier is a low-noise, differential input structure. This is an almost essential element when faced with amplification of low-amplitude analog signals in digitally intense environments such as note-

Differential Microphone Preamp with Internal Bias and Complete Shutdown

Functional Diagram

book PCs or PDAs. Used correctly, the advantages over a single-ended solution are:

- Better power-supply noise rejection.
- Less degradation from noise in PC board ground planes.
- The microphone and preamplifier may be placed physically further apart, easing PC board layout restrictions.

Differential-Gain Adjustment

The MAX4063 allows the user to alter the differential gain to optimize the signal-to-noise ratio (SNR) of their system. The gain is set by a single external resistor (R_G) connected between the G1 and G2 pins:

$$R_G = \frac{200\text{k}\Omega}{A_{VD} - 2}$$

where A_V is the required voltage gain.

Hence, an 11.11k Ω resistor yields a gain of 20V/V, or 26dB. Leaving the pins unconnected results in a gain of 2V/V. Gain is defined as:

For differential out:

$$A_{VD} = \frac{V_{OUT+} - V_{OUT-}}{V_{IN+} - V_{IN-}}$$

The resistor can be either fixed or variable, allowing the use of a digitally controlled potentiometer to alter the gain under software control.

Auxiliary Input-Gain Adjustment

The MAX4063 provides an option to increase the AUX_IN (see Figure 3). To increase the gain, connect resistor R_{ADJ} between the ADJ and AUX_IN pins. R_{ADJ} is calculated from the following formula:

$$R_{ADJ} = \frac{2\text{M}\Omega}{A_{V_{AUX}} - 20} \quad (\text{to increase the gain})$$

Differential Microphone Preamplifier with Internal Bias and Complete Shutdown

MAX4063

Figure 1. MAX4063 with Auxiliary Input Configuration

where:

$$AV_{AUX} = \frac{V_{OUT} - \overline{V_{OUT}}}{V_{AUX_IN}}$$

R_{ADJ} is placed between AUX_IN and ADJ.

Input Capacitors

The two differential microphone inputs and the single-ended auxiliary input of the MAX4063 have on-chip bias components, allowing the user to AC-couple any signals into the input. The input resistance is 100kΩ (typ), so the capacitor size may be chosen accordingly to define the LF rolloff desired. This can be calculated as:

$$C_{IN} = 1 / (2\pi f_{CUT} R_{IN})$$

This assumes a low source impedance is driving the inputs.

A further consideration for the differential input is the effect of these series input capacitors on low-frequency, common-mode rejection. Any mismatch in the values of these two capacitors degrades the CMRR at frequencies where the impedance of the capacitor is significant

compared to the input resistance of the amplifier—this is usually most noticeable at low frequencies. One way to avoid the need for matched or tight tolerance capacitors is to deliberately oversize the values on the differential inputs and to set the lower 3dB point (f_{CUT}) of the amplifier by sizing the output capacitor appropriately.

The input impedance matching on the differential input is typically 1%, allowing input capacitor matching to be effective at improving low-frequency PSRR.

Common-Mode Rejection Ratio

The common-mode rejection ratio (CMRR) refers to the amount of rejection that the amplifier is capable of providing to any signal applied equally to the IN+ and IN- inputs. In the case of amplifying low-level microphone signals in noisy digital environments, it is a key figure of merit. In audio circuits, this is generally measured for V_{IN} as an AC signal:

$$CMRR(dB) = A_{DM} / A_{CM}$$

where A_{DM} is the differential gain, A_{CM} is the common-mode gain.

Input voltages should be sufficiently small such that the output is not clipped in either differential or common-

Differential Microphone Preamplifier with Internal Bias and Complete Shutdown

mode application. The topology used in the MAX4063 means that the CMRR actually improves at higher differential gains—another advantage of using differential sensing.

Auxiliary Input

The auxiliary input is a single-ended input intended to be used with a jack-socket type microphone input (Figure 1). Internal DC-bias components (as on the main inputs) allow the input signal to be AC-coupled. Mechanically switched jack sockets can be used in conjunction with the $\overline{\text{INT/AUX}}$ select pin, allowing the auxiliary microphone input to be automatically selected when a jack socket is inserted.

Microphone Bias Voltage

On the MAX4063 thin QFN package, connect the exposed paddle (backside of PRS) to the ground plane. The MAX4063 has an integrated low-noise, low-output impedance bias voltage. An optimum electret bias resistor can be set externally. This gives a low-noise, flexible solution that can run from 2.4V to 5.5V, which is suitable for hand-held devices such as PDAs that typically have audio power supplies in the 3V region (Figure 2).

Output

DC Bias

In shutdown mode, the bias voltage is disabled. $\overline{\text{OUT}}$ and $\overline{\text{OUT}}$ have a low-noise, DC-bias voltage independent of the power supplies, resulting in superior PSRR performance. The MAX4063 outputs are high impedance when the part is in shutdown mode.

Differential Output

The MAX4063 features a differential output stage ($\overline{\text{OUT}}$ and $\overline{\text{OUT}}$), allowing optimum performance when connected to ADCs and CODECs with differential inputs. This differential output is particularly useful in designs where the microphone preamplifier is mounted some distance away from the CODEC/ADC, as the low-impedance, differential line provides excellent noise rejection and immunity (Figure 4).

Figure 2. MAX4063 Used for Biasing a Microphone

Applications Information

Shutdown Mode

The MAX4063 features a low-power, complete shutdown mode. When $\overline{\text{SHDN}}$ goes low, the supply current drops to 0.3 μA , the output enters a high-impedance state, and the bias current to the microphone is switched off. Driving $\overline{\text{SHDN}}$ high enables the amplifier. $\overline{\text{SHDN}}$ should not be left unconnected.

Power Supplies and Layout

The MAX4063 operates from a 2.4V to 5.5V single supply. Bypass the power supply with a 0.1 μF capacitor to ground. In systems where analog and digital grounds are available, the MAX4063 should be connected to the analog ground.
