

# TPS732 Capacitor-Free, NMOS, 250mA, Low-Dropout Regulator With Reverse Current **Protection**

#### 1 Features

- Stable with no output capacitor or any value or type of capacitor
- Input voltage range: 1.7V to 5.5V
- Ultra-low dropout voltage: 40mV typical at 250mA
- Excellent load transient response—with or without optional output capacitor
- NMOS topology provides low reverse leakage
- Low noise:  $30\mu V_{RMS}$  typical (10kHz to 100kHz)
- 0.5% initial accuracy
- 1% overall accuracy (line, load, and temperature)
- Less than 1µA maximum I<sub>O</sub> in shutdown mode
- Thermal shutdown and specified min and max current limit protection
- Available in multiple output voltage versions:
  - Fixed outputs of 1.2V to 5V
  - Adjustable outputs from 1.2V to 5.5V
  - Custom outputs available

## 2 Applications

- Portable and battery-powered equipment
- Post-regulation for switching supplies
- Noise-sensitive circuitry such as VCOs
- Point of load regulation for DSPs, FPGAs, ASICs, and microprocessors

## 3 Description

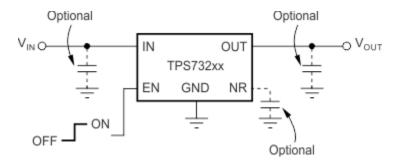

The TPS732 low-dropout (LDO) voltage regulator uses an NMOS pass transistor in a voltage-follower configuration. This topology is stable using output capacitors with low equivalent series resistance (ESR), and even allows operation without a capacitor. The device also provides high reverse blockage (low reverse current) and ground pin current that is nearly constant over all values of output current.

The TPS732 uses an advanced BiCMOS process to yield high precision while delivering very low dropout voltages and low ground pin current. Current consumption, when not enabled, is less than 1µA and designed for portable applications. The extremely low output noise (30 $\mu$ V<sub>RMS</sub> with 0.1 $\mu$ F C<sub>NR</sub>) is designed for powering VCOs. This device is protected by thermal shutdown and foldback current limit.

#### **Package Information**

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>
	DBV (SOT-23, 5)	2.9mm × 2.8mm
TPS732	DCQ (SOT-223, 6)	6.5mm × 7.06mm
	DRB (VSON, 8)	3mm × 3mm

- For more information, see the Mechanical, Packaging, and Orderable Information.
- The package size (length × width) is a nominal value and (2) includes pins, where applicable.

Typical Application Circuit for Fixed-Voltage Versions

- (1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application note.
- (2) For thermal estimates of this device based on PCB copper area, see the TI PCB Thermal Calculator.
- (3) Thermal data for the DRB, DCQ, and DBV packages are derived by thermal simulations based on JEDEC-standard methodology as specified in the JESD51 series. The following assumptions are used in the simulations:
  - (a) i. DRB: The exposed pad is connected to the PCB ground layer through a 2x2 thermal via array.
  - ii. DCQ: The exposed pad is connected to the PCB ground layer through a 3x2 thermal via array.
  - iii. DBV: There is no exposed pad with the DBV package.
  - (b) i. DRB: The top and bottom copper layers are assumed to have a 20% thermal conductivity of copper representing a 20% copper coverage.
  - ii. DCQ: Each of top and bottom copper layers has a dedicated pattern for 20% copper coverage.
  - iii. DBV: The top and bottom copper layers are assumed to have a 20% thermal conductivity of copper representing a 20% copper coverage.
  - (c) These data were generated with only a single device at the center of a JEDEC high-K (2s2p) board with 3in × 3in copper area. To understand the effects of the copper area on thermal performance, see the Power Dissipation section of this data sheet.

## **6 Detailed Description**

#### 6.1 Overview

The TPS732 low-dropout linear regulator operates down to an input voltage of 1.7V and supports output voltages down to 1.2V while sourcing up to 250mA of load current. This linear regulator uses an NMOS pass transistor with an integrated 4MHz charge pump to provide a dropout voltage of less than 150mV at full load current. This unique architecture also permits stable regulation over a wide range of output capacitors. Furthermore, the TPS732 does not require any output capacitor for stability. The increased insensitivity to the output capacitor value and type makes this linear regulator designed for powering a load where the effective capacitance is unknown.

The TPS732 also features a noise-reduction (NR) pin that allows for additional reduction of the output noise. With a noise reduction capacitor of  $0.01\mu F$  connected from the NR pin to GND, the TPS73215 typical output noise is  $12.75\mu V_{RMS}$ . The low noise output featured by the TPS732 makes the device designed for powering VCOs or any other noise-sensitive load.

## 6.2 Functional Block Diagrams

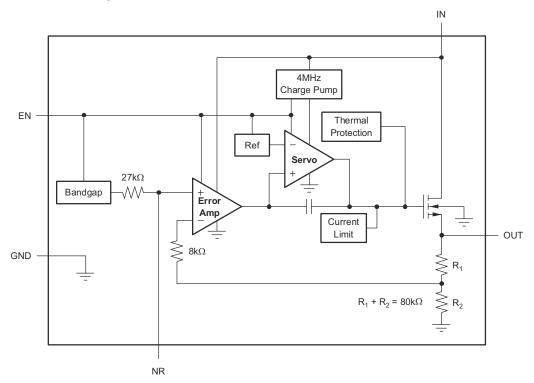

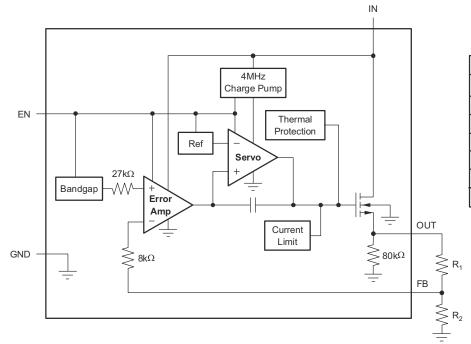

Figure 6-1. Fixed-Voltage Version

#### Table 1. Standard 1% Resistor Values for Common Output Voltages

Vo	R <sub>1</sub>	R <sub>2</sub>
1.2V	Short	Open
1.5V	23.2kΩ	95.3kΩ
1.8V	28.0kΩ	56.2kΩ
2.5V	39.2kΩ	36.5kΩ
2.8V	44.2kΩ	33.2kΩ
3.0V	46.4kΩ	30.9kΩ
3.3V	52.3kΩ	30.1kΩ

NOTE:  $V_{OUT} = (R_1 + R_2)/R_2 \times 1.204$ ;  $R_1 || R_2 \cong 19k\Omega$  for best accuracy.

Figure 6-2. Adjustable-Voltage Version

#### 6.3 Feature Description

#### 6.3.1 Output Noise

A precision band-gap reference is used to generate the internal reference voltage,  $V_{REF}$ . This reference is the dominant noise source within the TPS732 and generates approximately  $32\mu V_{RMS}$  (10Hz to 100kHz) at the reference output (NR). The regulator control loop gains up the reference noise with the same gain as the reference voltage, so that the noise voltage of the regulator is approximately given by:

$$V_{N} = 32\mu V_{RMS} \times \left(\frac{R_{1} + R2}{R_{2}}\right) = 32\mu V_{RMS} \times \frac{V_{OUT}}{V_{REF}}$$

$$\tag{1}$$

Because the value of  $V_{REF}$  is 1.2V, this relationship reduces to:

$$V_{N}(\mu V_{RMS}) = 27 \left(\frac{\mu V_{RMS}}{V}\right) \times V_{OUT}(V)$$
(2)

An internal  $27k\Omega$  resistor in series with the noise-reduction pin (NR) forms a low-pass filter for the voltage reference when an external noise-reduction capacitor,  $C_{NR}$ , is connected from NR to ground. For  $C_{NR}$  = 10nF, the total noise in the 10Hz to 100kHz bandwidth is reduced by a factor of approximately 3.2, giving the approximate relationship:

$$V_{N}(\mu V_{RMS}) = 8.5 \left(\frac{\mu V_{RMS}}{V}\right) \times V_{OUT}(V)$$
(3)

for  $C_{NR} = 10nF$ .

This noise-reduction effect is shown as RMS Noise Voltage vs  $C_{NR}$  (Figure 5-33) in the Typical Characteristics section.

The TPS73201 adjustable version does not have the NR pin available. However, connecting a feedback capacitor, C<sub>FB</sub>, from the output to the feedback pin (FB) reduces output noise and improves load transient performance.

The TPS732 uses an internal charge pump to develop an internal supply voltage sufficient to drive the gate of the NMOS pass transistor above  $V_{OUT}$ . The charge pump generates approximately 250 $\mu$ V of switching noise at approximately 4MHz; however, charge-pump noise contribution is negligible at the output of the regulator for most values of  $I_{OUT}$  and  $C_{OUT}$ .

#### 6.3.2 Internal Current Limit

The TPS732 internal current limit helps protect the regulator during fault conditions. Foldback current limit helps to protect the regulator from damage during output short-circuit conditions by reducing current limit when V<sub>OUT</sub> drops below 0.5V. See Figure 5-17 in the *Typical Characteristics* section for a graph of I<sub>OUT</sub> vs V<sub>OUT</sub>.

From Figure 5-17 approximately -0.2V of  $V_{OUT}$  results in a current limit of 0mA. Therefore, if OUT is forced below -0.2V before EN goes high, the device potentially does not start up. In applications that work with both a positive and negative voltage supply, enable the TPS732 first.

#### 6.3.3 Enable Pin and Shutdown

The enable pin (EN) is active high and is compatible with standard TTL-CMOS levels. A  $V_{EN}$  below 0.5V (maximum) turns the regulator off and drops the GND pin current to approximately 10nA. When EN is used to shut down the regulator, all charge is removed from the pass transistor gate. A  $V_{EN}$  above 1.7V (minimum) turns the regulator on and the output ramps back up to a regulated  $V_{OUT}$  (see Figure 5-39).

When shutdown capability is not required, connect EN to  $V_{IN}$ . However, the pass transistor potentially does not discharge using this configuration, causing the pass transistor to be left on (enhanced) for a significant time after  $V_{IN}$  is removed. This scenario results in reverse current flow (if the IN pin is low impedance) and faster ramp times upon power up. In addition, for  $V_{IN}$  ramp times slower than a few milliseconds, the output potentially overshoots upon power up.

Current limit foldback prevents device start-up under some conditions. See the *Internal Current Limit* section.

#### 6.3.4 Dropout Voltage

The TPS732 uses an NMOS pass transistor to achieve extremely low dropout. When  $(V_{IN} - V_{OUT})$  is less than the dropout voltage  $(V_{DO})$ , the NMOS pass transistor is in the linear region of operation and the input-to-output resistance is the  $R_{DS(on)}$  of the NMOS pass transistor.

For large step changes in load current, the TPS732 requires a larger voltage drop from  $V_{IN}$  to  $V_{OUT}$  to avoid degraded transient response. The boundary of this transient dropout region is approximately twice the DC dropout. Values of  $(V_{IN} - V_{OUT})$  above this line provide normal transient response.

Operating in the transient dropout region causes an increase in recovery time. The time required to recover from a load transient is a function of the magnitude of the change in load current rate, the rate of change in load current, and the available headroom ( $V_{IN}$  to  $V_{OUT}$  voltage drop). Under worst-case conditions [full-scale instantaneous load change with ( $V_{IN} - V_{OUT}$ ) close to DC dropout levels], the TPS732 takes a couple of hundred microseconds to return to the specified regulation accuracy.

Submit Document Feedback

#### 6.3.5 Reverse Current

The NMOS pass transistor of the TPS732 provides inherent protection against current flow from the output of the regulator to the input when the gate of the pass transistor is pulled low. To make sure all charge is removed from the gate of the pass transistor, drive the EN pin low before the input voltage is removed. If this process is not done, the pass transistor is potentially left on because of stored charge on the transistor.

After the EN pin is driven low, no bias voltage is needed on any pin for reverse current blocking. Reverse current is specified as the current flowing out of the IN pin resulting from the voltage applied on the OUT pin. Additional current flows into the OUT pin from the  $80k\Omega$  internal resistor divider to ground (see Figure 6-1 and Figure 6-2).

For the TPS73201, reverse current potentially flows when V<sub>FB</sub> is more than 1V above V<sub>IN</sub>.

#### 6.4 Device Functional Modes

## 6.4.1 Normal Operation With 1.7V ≤ $V_{IN}$ ≤ 5.5V and $V_{EN}$ ≥ 1.7V

The TPS732 requires an input voltage of at least 1.7V to function properly and attempt to maintain regulation.

When operating the device near 5.5V, suppress any transient spikes that exceed the 6V absolute maximum voltage rating. Never operate the device at a DC voltage greater than 5.5V.

## 7 Application and Implementation

#### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

## 7.1 Application Information

The TPS732 LDO regulator uses an NMOS pass transistor to achieve ultra-low-dropout performance, reverse current blockage, and freedom from output capacitor constraints. These features, combined with low noise and an enable input, make the TPS732 designed for portable applications. This regulator offers a wide selection of fixed-output voltage versions and an adjustable-output version. All versions have thermal and overcurrent protection, including foldback current limit.

#### 7.2 Typical Application

Figure 7-1 shows the basic circuit connections for the fixed-voltage models. Figure 7-2 gives the connections for the adjustable-voltage version (TPS73201).

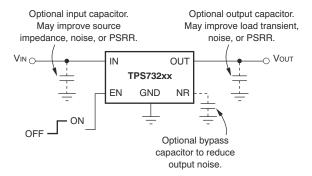

Figure 7-1. Typical Application Circuit for Fixed-Voltage Versions

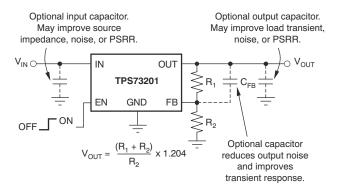

Figure 7-2. Typical Application Circuit for Adjustable-Voltage Version

#### 7.2.1 Design Requirements

 $R_1$  and  $R_2$  are calculated for any output voltage using the formula in Figure 7-2. Sample resistor values for common output voltages are given in Figure 6-2.

For best accuracy, make the parallel combination of  $R_1$  and  $R_2$  approximately equal to  $19k\Omega$ . This  $19k\Omega$ , in addition to the internal  $8k\Omega$  resistor, presents the same impedance to the error amplifier as the  $27k\Omega$  band-gap reference output. This impedance helps compensate for leakages into the error amplifier terminals.

#### 7.2.2 Detailed Design Procedure

#### 7.2.2.1 Input and Output Capacitor Requirements

Although an input capacitor is not required for stability, good analog design practice is to connect a 0.1µF to 1µF, low ESR capacitor across the input supply near the regulator. This capacitor counteracts reactive input sources and improves transient response, noise rejection, and ripple rejection. A higher-value capacitor is necessary if large, fast rise-time load transients are anticipated or the device is located several inches from the power source.

The TPS732 does not require an output capacitor for stability and has maximum phase margin with no capacitor. The device is designed to be stable for all available types and values of capacitors. In applications where multiple low ESR capacitors are in parallel, ringing potentially occurs when the product of  $C_{OUT}$  and total ESR drops below  $50nF \times \Omega$ . Total ESR includes all parasitic resistances, including capacitor ESR and board, socket, and solder joint resistance. In most applications, the sum of capacitor ESR and trace resistance meets this requirement.

#### 7.2.2.2 Transient Response

The low open-loop output impedance provided by the NMOS pass transistor in a voltage follower configuration allows operation without an output capacitor for many applications. As with any regulator, the addition of a capacitor (nominal value  $1\mu F$ ) from the OUT pin to ground reduces undershoot magnitude but increases the duration. In the adjustable version, the addition of a capacitor,  $C_{FB}$ , from the OUT pin to the FB pin also improves transient response.

The TPS732 does not have active pulldown when the output is overvoltage. This feature allows applications that connect higher voltage sources, such as alternate power supplies, to the output. This feature also results in an output overshoot of several percent if the load current quickly drops to zero when a capacitor is connected to the output. The duration of overshoot is reduced by adding a load resistor. The overshoot decays at a rate determined by output capacitor  $C_{\text{OUT}}$  and the internal or external load resistance. The rate of decay is given by:

(Fixed voltage versions)

$$dV / dt = \frac{V_{OUT}}{C_{OUT} \times 80k\Omega \parallel R_{LOAD}}$$
(4)

(Adjustable voltage version)

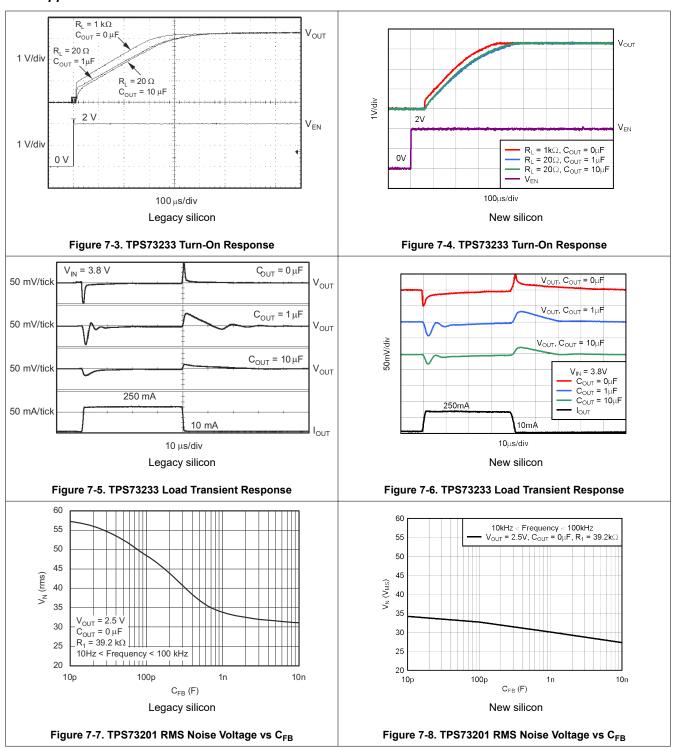

$$dV / dt = \frac{V_{OUT}}{C_{OUT} \times 80k\Omega \| (R_1 + R_2) \| R_{LOAD}}$$
(5)

#### 7.2.3 Application Curves

#### 7.2.3 Application Curves (continued)

#### 7.3 Power Supply Recommendations

This device is designed to operate from an input voltage supply range between 1.7V and 5.5V. The input voltage range provides adequate headroom for the device to have a regulated output. Make sure this input supply is well regulated. If the input supply is noisy, additional input capacitors with low ESR help improve output noise performance.

#### 7.4 Layout

#### 7.4.1 Layout Guidelines

To improve AC performance such as PSRR, output noise, and transient response, design the PCB with ground plane connections for  $V_{IN}$  and  $V_{OUT}$  capacitors, and connect the ground plane at the GND pin of the device. In addition, the ground connection for the bypass capacitor should connect directly to the GND pin of the device.

#### 7.4.1.1 Thermal Considerations

Thermal protection disables the output when the junction temperature rises to approximately 160°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit potentially cycles on and off. This cycling limits the dissipation of the regulator, protecting the regulator from damage caused by overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heat sink. For reliable operation, limit junction temperature to 125°C maximum. To estimate the margin of safety in a complete design (including heat sink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection triggers at least 35°C above the maximum expected ambient condition of the application. This level produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS732 is designed to protect against overload conditions. This circuitry is not intended to replace proper heat sinking. Continuously running the TPS732 into thermal shutdown degrades device reliability.

#### 7.4.1.1.1 Power Dissipation

The ability to remove heat from the die is different for each package type, presenting different considerations in the PCB layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Performance data for JEDEC low- and high-K boards are shown in the *Thermal Information* table. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves the heat-sink effectiveness.

Power dissipation depends on input voltage and load conditions. Power dissipation ( $P_D$ ) is equal to the product of the output current times the voltage drop across the output pass transistor ( $V_{IN}$  to  $V_{OUT}$ ):

$$P_{D} = (V_{IN} - V_{OUT}) \times I_{OUT}$$
(6)

Power dissipation is minimized by using the lowest possible input voltage necessary to provide the required output voltage.

## 8 Device and Documentation Support

## 8.1 Device Support

#### 8.1.1 Development Support

#### 8.1.1.1 Evaluation Modules

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the TPS732. Request the TPS73201DRBEVM-518 evaluation module (and related user guide) at the Texas Instruments website through the product folders or purchased directly from the TI eStore.

#### 8.1.1.2 Spice Models

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. A SPICE model for the TPS732 is available through the product folders under Simulation Models.

#### 8.1.2 Device Nomenclature

**Table 8-1. Device Nomenclature** 

PRODUCT <sup>(1)</sup>	DESCRIPTION
TPS732 <b>xx<i>yyyz(M3)</i></b>	<ul> <li>xx is the nominal output voltage (for example, 25 = 2.5V; 01 = Adjustable).</li> <li>yyy is the package designator.</li> <li>z is the tape and reel quantity (R = 3000, T = 250).</li> <li>M3 is a suffix designator for devices that only use the latest manufacturing flow (CSO: RFB).</li> <li>Devices without this suffix ship with the <i>legacy silicon</i> (CSO: DLN) or the <i>new silicon</i> (CSO: RFB). The reel packaging label provides CSO information to distinguish which silicon is being used. Device performance for new and legacy silicon is denoted throughout the document.</li> </ul>

<sup>(1)</sup> For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

#### 8.2 Documentation Support

#### 8.2.1 Related Documentation

- Texas Instruments, Regulating V<sub>OUT</sub> Below 1.2 V Using an External Reference application note
- Texas Instruments, TPS73x01DRBEVM-518 User's Guide

#### 8.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

#### **8.4 Support Resources**

TI E2E<sup>™</sup> support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

#### 8.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

## 8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

#### 8.7 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

## 9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision Q (September 2024) to Revision R (May 2025)	Page
Added new silicon DBV thermals	
Updated DRB (VSON) for DRB0008A package outline	
Changed legacy chip to legacy silicon in Device Nomenclature table	
Changes from Revision P (December 2015) to Revision Q (September 2024)	Page
<ul> <li>Updated the numbering format for tables, figures, and cross-references throughout the document</li> </ul>	t
Changed SON to VSON throughout document	
Added new silicon ground pin current spec	
Added new silicon shutdown current spec	
Added new silicon plots to Typical Characteristics	
<ul> <li>Changed load current max source from 500mA to 250mA and dropout voltage from 250mV to 15</li> </ul>	
Overview section	
<ul> <li>Changed total ESR drops below 50nΩF to total ESR drops below 50nF × Ω in Input and Output Ω</li> </ul>	
Requirements section	•
Added new silicon plots to Application Curves section	
Changed Layout Guidelines section	2
Added DBV and DCQ layout figures to Layout Examples section	
Added M3 information to Device Nomenclature	

# 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

#### OTHER QUALIFIED VERSIONS OF TPS732:

Automotive: TPS732-Q1

NOTE: Qualified Version Definitions:

Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.

4203482/L

PLASTIC SMALL OUTLINE - NO LEAD

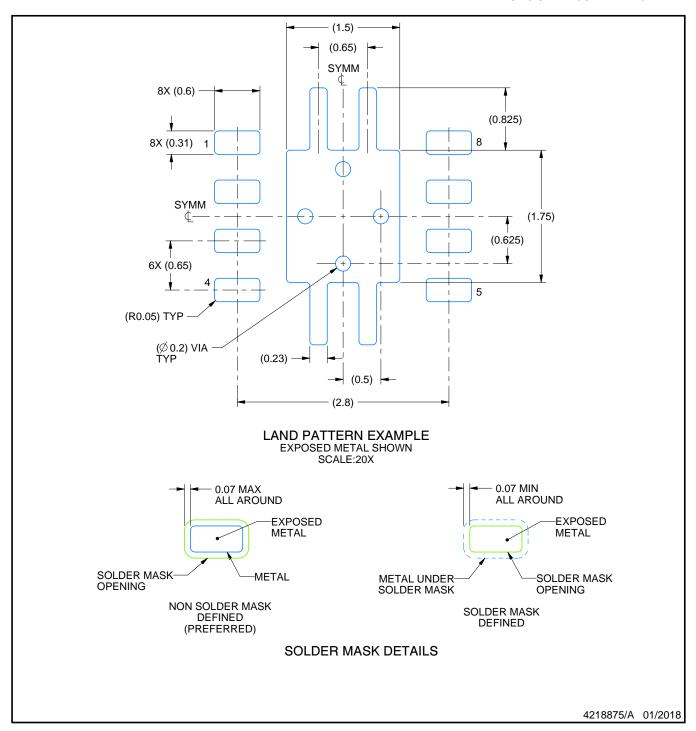

#### NOTES:

- All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

PLASTIC SMALL OUTLINE - NO LEAD

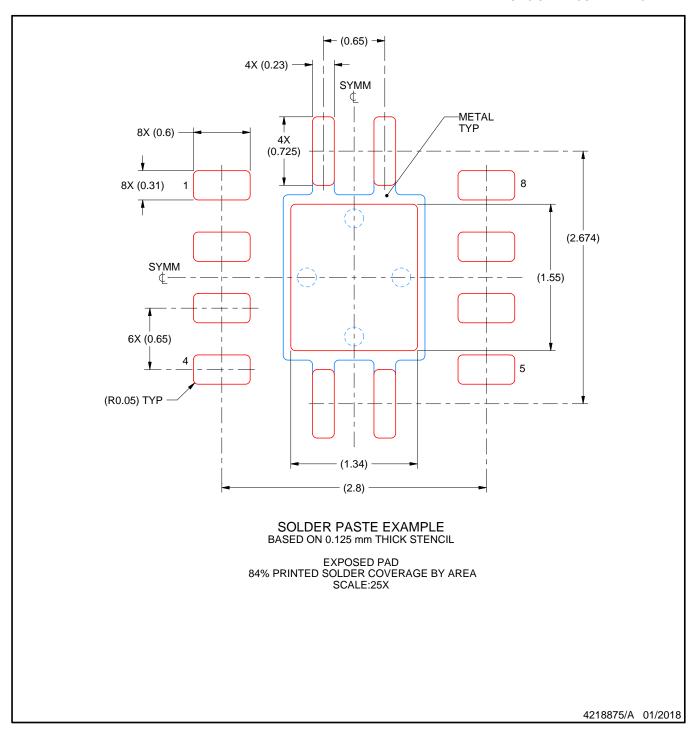

NOTES: (continued)

- 4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- 5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

PLASTIC SMALL OUTLINE - NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

SMALL OUTLINE TRANSISTOR

#### NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
  2. This drawing is subject to change without notice.
  3. Reference JEDEC MO-178.

- 4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
- 5. Support pin may differ or may not be present.

SMALL OUTLINE TRANSISTOR

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SMALL OUTLINE TRANSISTOR

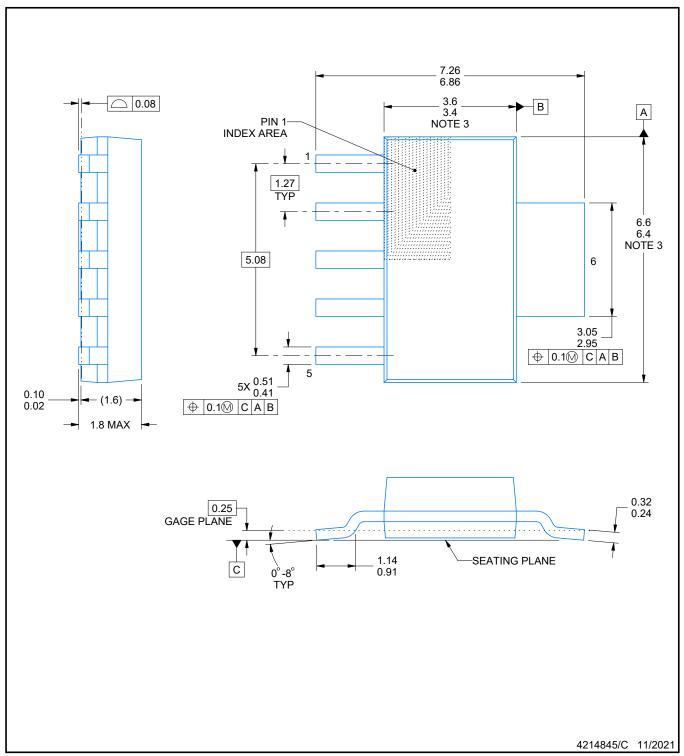

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

PLASTIC SMALL OUTLINE

#### NOTES:

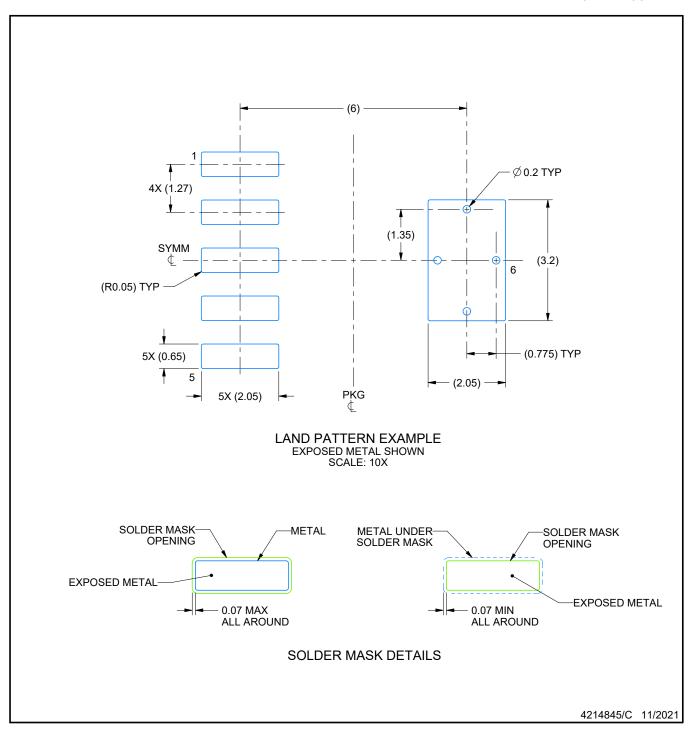

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

  2. This drawing is subject to change without notice.

  3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
- exceed 0.15 mm per side.

PLASTIC SMALL OUTLINE

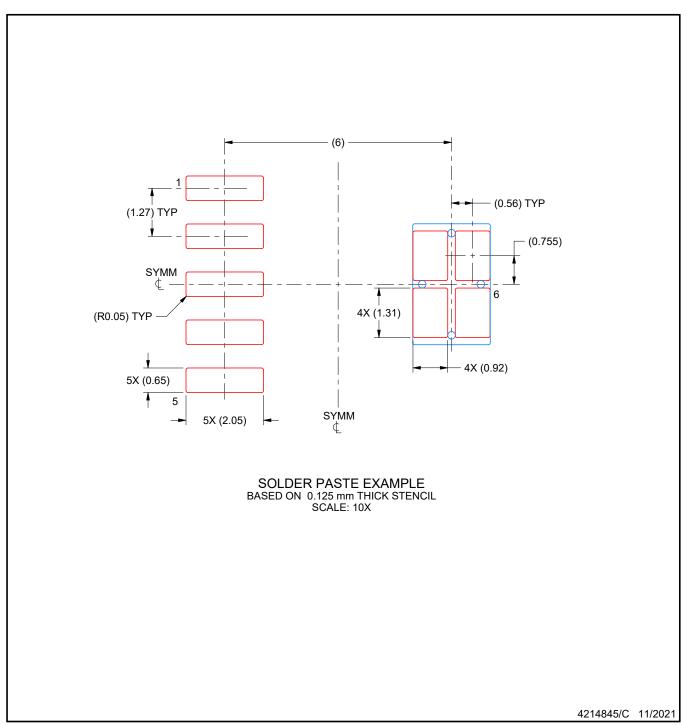

NOTES: (continued)

- 4. Publication IPC-7351 may have alternate designs.
- 5. Solder mask tolerances between and around signal pads can vary based on board fabrication site.6. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
