

K70P256M150SF3

K70 Sub-Family

Supports the following:

MK70FX512VMJ15,
MK70FN1M0VMJ15

Key features

- Operating Characteristics
 - Voltage range: 1.71 to 3.6 V
 - Flash write voltage range: 1.71 to 3.6 V
 - Temperature range (ambient): -40 to 105°C
- Performance
 - Up to 150 MHz Arm® Cortex®-M4 core with DSP instructions delivering 1.25 Dhrystone MIPS per MHz
- Memories and memory interfaces
 - Up to 1024 KB program flash memory on non-FlexMemory devices
 - Up to 512 KB program flash memory on FlexMemory devices
 - Up to 512 KB FlexNVM on FlexMemory devices
 - 16 KB FlexRAM on FlexMemory devices
 - Up to 128 KB RAM
 - Serial programming interface (EzPort)
 - FlexBus external bus interface
 - DDR controller interface
 - NAND flash controller interface
- Clocks
 - 3 to 32 MHz crystal oscillator
 - 32 kHz crystal oscillator
 - Multi-purpose clock generator
- System peripherals
 - Multiple low-power modes to provide power optimization based on application requirements
 - Memory protection unit with multi-master protection
 - 32-channel DMA controller, supporting up to 128 request sources
 - External watchdog monitor
 - Software watchdog
 - Low-leakage wakeup unit
- Security and integrity modules
 - Hardware CRC module to support fast cyclic redundancy checks
 - Tamper detect and secure storage
 - Hardware random-number generator
 - Hardware encryption supporting DES, 3DES, AES, MD5, SHA-1, and SHA-256 algorithms
 - 128-bit unique identification (ID) number per chip
- Human-machine interface
 - Graphic LCD controller
 - Low-power hardware touch sensor interface (TSI)
 - General-purpose input/output
- Analog modules
 - Four 16-bit SAR ADCs
 - Programmable gain amplifier (PGA) (up to x64) integrated into each ADC
 - Two 12-bit DACs
 - Four analog comparators (CMP) containing a 6-bit DAC and programmable reference input
 - Voltage reference
- Timers
 - Programmable delay block
 - Two 8-channel motor control/general purpose/PWM timers
 - Two 2-channel quadrature decoder/general purpose timers
 - IEEE 1588 timers
 - Periodic interrupt timers
 - 16-bit low-power timer
 - Carrier modulator transmitter
 - Real-time clock

- Communication interfaces
 - Ethernet controller with MII and RMI interface to external PHY and hardware IEEE 1588 capability
 - USB high-/full-/low-speed On-the-Go controller with ULPI interface
 - USB full-/low-speed On-the-Go controller with on-chip transceiver
 - USB Device Charger detect (USBDCD)
 - Two Controller Area Network (CAN) modules
 - Three SPI modules
 - Two I2C modules
 - Six UART modules
 - Secure Digital Host Controller (SDHC)
 - Two I2S modules

1 Ordering parts

1.1 Determining valid orderable parts

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to nxp.com and perform a part number search for the following device numbers: PK70 and MK70

2 Part identification

2.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

2.2 Format

Part numbers for this device have the following format:

Q K## A M FFF T PP CC N

2.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

Field	Description	Values
Q	Qualification status	<ul style="list-style-type: none"> M = Fully qualified, general market flow P = Prequalification
K##	Kinetis family	<ul style="list-style-type: none"> K70
A	Key attribute	<ul style="list-style-type: none"> F = Cortex-M4 w/ DSP and FPU
M	Flash memory type	<ul style="list-style-type: none"> N = Program flash only X = Program flash and FlexMemory
FFF	Program flash memory size	<ul style="list-style-type: none"> 512 = 512 KB 1M0 = 1 MB

3 Terminology and guidelines

3.1 Definitions

Key terms are defined in the following table:

Term	Definition
Rating	<p>A minimum or maximum value of a technical characteristic that, if exceeded, may cause permanent chip failure:</p> <ul style="list-style-type: none">• <i>Operating ratings</i> apply during operation of the chip.• <i>Handling ratings</i> apply when the chip is not powered. <p>NOTE: The likelihood of permanent chip failure increases rapidly as soon as a characteristic begins to exceed one of its operating ratings.</p>
Operating requirement	<p>A specified value or range of values for a technical characteristic that you must guarantee during operation to avoid incorrect operation and possibly decreasing the useful life of the chip</p>
Operating behavior	<p>A specified value or range of values for a technical characteristic that are guaranteed during operation if you meet the operating requirements and any other specified conditions</p>
Typical value	<p>A specified value for a technical characteristic that:</p> <ul style="list-style-type: none">• Lies within the range of values specified by the operating behavior• Is representative of that characteristic during operation when you meet the typical-value conditions or other specified conditions <p>NOTE: Typical values are provided as design guidelines and are neither tested nor guaranteed.</p>

3.2 Examples

Operating rating:

Symbol	Description	Min.	Max.	Unit
V _{DD}	1.0 V core supply voltage	-0.3	1.2	V

Operating requirement:

Symbol	Description	Min.	Max.	Unit
V _{DD}	1.0 V core supply voltage	0.9	1.1	V

Operating behavior that includes a typical value:

Symbol	Description	Min.	Typ.	Max.	Unit
I _{WP}	Digital I/O weak pullup/pulldown current	10	70	130	μA

3.3 Typical-value conditions

Typical values assume you meet the following conditions (or other conditions as specified):

Symbol	Description	Value	Unit
T _A	Ambient temperature	25	°C
V _{DD}	Supply voltage	3.3	V

3.4 Relationship between ratings and operating requirements

3.5 Guidelines for ratings and operating requirements

Follow these guidelines for ratings and operating requirements:

- Never exceed any of the chip’s ratings.
- During normal operation, don’t exceed any of the chip’s operating requirements.
- If you must exceed an operating requirement at times other than during normal operation (for example, during power sequencing), limit the duration as much as possible.

4 Ratings

4.1 Thermal handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
T _{STG}	Storage temperature	-55	150	°C	1
T _{SDR}	Solder temperature, lead-free	—	260	°C	2

1. Determined according to JEDEC Standard JESD22-A103, *High Temperature Storage Life*.
 2. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

4.2 Moisture handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
MSL	Moisture sensitivity level	—	3	—	1

1. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

4.3 ESD handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
V _{HBM}	Electrostatic discharge voltage, human body model	-2000	+2000	V	1
V _{CDM}	Electrostatic discharge voltage, charged-device model	-500	+500	V	2
I _{LAT}	Latch-up current at ambient temperature of 105°C	-100	+100	mA	3

1. Determined according to JEDEC Standard JESD22-A114, *Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)*.
2. Determined according to JEDEC Standard JESD22-C101, *Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components*.
3. Determined according to JEDEC Standard JESD78, *IC Latch-Up Test*.

4.4 Voltage and current operating ratings

I _{DD}	Digital supply current	—	300	mA
I _{DD_INT}	Core supply current	—	185	mA
I _{DD_DDR}	DDR supply current	—	220	mA
V _{DIO}	Digital input voltage (except RESET, EXTAL0/XTAL0, and EXTAL1/XTAL1) ²	-0.3	5.5	V
V _{DDDR}	DDR input voltage	-0.3	V _{DD_DDR} + 0.3	V
V _{AIO}	Analog ³ , RESET, EXTAL0/XTAL0, and EXTAL1/XTAL1 input voltage	-0.3	V _{DD} + 0.3	V
I _D	Maximum current single pin limit (applies to all digital pins)	-25	25	mA
V _{DDA}	Analog supply voltage	V _{DD} - 0.3	V _{DD} + 0.3	V
V _{USB0_DP}	USB0_DP input voltage	-0.3	3.63	V
V _{USB1_DP}	USB1_DP input voltage	-0.3	3.63	V

General

Symbol	Description	Min.	Max.	Unit
V _{USB0_DM}	USB0_DM input voltage	-0.3	3.63	V
V _{USB1_DM}	USB1_DM input voltage	-0.3	3.63	V
V _{REGIN}	USB regulator input	-0.3	6.0	V
V _{BAT}	RTC battery supply voltage	-0.3	3.8	V

1. It applies for all port pins except Tamper pins.
2. It covers digital pins except Tamper pins and DDR pins.
3. Analog pins are defined as pins that do not have an associated general purpose I/O port function.

5 General

5.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the 50% to the 50% point, and rise and fall times are measured at the 20% and 80% points, as shown in the following figure.

Figure 1. Input signal measurement reference

All digital I/O switching characteristics assume:

1. output pins
 - have $C_L=30\text{pF}$ loads,
 - are configured for fast slew rate ($\text{PORTx_PCRn[SRE]}=0$), and
 - are configured for high drive strength ($\text{PORTx_PCRn[DSE]}=1$)
2. input pins
 - have their passive filter disabled ($\text{PORTx_PCRn[PFE]}=0$)

- For DDR1/DDR2, connect V_{REF_DDR} to the same reference voltage used for the memory. For LPDDR1, connect V_{REF_DDR} to the V_{DD_DDR} voltage.
- All 5 V tolerant digital I/O pins are internally clamped to V_{SS} through an ESD protection diode. There is no diode connection to V_{DD} . If V_{IN} is less than V_{DIO_MIN} , a current limiting resistor is required. If V_{IN} greater than V_{DIO_MIN} ($=V_{SS}-0.3V$) is observed, then there is no need to provide current limiting resistors at the pads. The negative DC injection current limiting resistor is calculated as $R=(V_{DIO_MIN}-V_{IN})/|I_{ICDIO}|$.
- Analog pins are defined as pins that do not have an associated general purpose I/O port function. Additionally, EXTAL and XTAL are analog pins.
- All analog pins are internally clamped to V_{SS} and V_{DD} through ESD protection diodes. If V_{IN} is less than V_{AIO_MIN} or greater than V_{AIO_MAX} , a current limiting resistor is required. The negative DC injection current limiting resistor is calculated as $R=(V_{AIO_MIN}-V_{IN})/|I_{ICAIO}|$. The positive injection current limiting resistor is calculated as $R=(V_{IN}-V_{AIO_MAX})/|I_{ICAIO}|$. Select the larger of these two calculated resistances if the pin is exposed to positive and negative injection currents.
- Open drain outputs must be pulled to V_{DD} .

General

1. Analog pins are defined as pins that do not have an associated general purpose I/O port function.
2. Digital pins have an associated GPIO port function and have 5V tolerant inputs, except EXTAL and XTAL.
3. Internal pull-up/pull-down resistors disabled.
4. Characterized, not tested in production.
5. Examples calculated using V_{IL} relation, V_{DD} , and max I_{IND} : $Z_{IND}=V_{IL}/I_{IND}$. This is the impedance needed to pull a high signal to a level below V_{IL} due to leakage when $V_{IL} < V_{IN} < V_{DD}$. These examples assume signal source low = 0 V. See [Figure 2](#).
6. Measured at V_{DD} supply voltage = V_{DD} min and $V_{input} = V_{SS}$
7. Measured at V_{DD} supply voltage = V_{DD} min and $V_{input} = V_{DD}$

5. 4 MHz core, system, 2 MHz FlexBus, and 2 MHz bus clock and 0.5 MHz flash clock. MCG configured for BLPE mode. All peripheral clocks disabled.
6. Includes 32kHz oscillator current and RTC operation.

5.2.5.1 Diagram: Typical I_{DD_RUN} operating behavior

The following data was measured under these conditions:

- MCG in FBE mode for 50 MHz and lower frequencies. MCG in FEE mode at greater than 50 MHz frequencies. MCG in PEE mode at greater than 100 MHz frequencies.

- USB regulator disabled
- No GPIOs toggled
- Code execution from flash with cache enabled
- For the ALLOFF curve, all peripheral clocks are disabled except FTFE

1. Determined according to IEC Standard 61967-1, *Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 1: General Conditions and Definitions* and IEC Standard 61967-2, *Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 2: Measurement of Radiated Emissions—TEM Cell and Wideband TEM Cell Method*. Measurements were made while the microcontroller was running basic application code. The reported emission level is the value of the maximum measured emission, rounded up to the next whole number, from among the measured orientations in each frequency range.
2. V_{DD} = 3.3 V, T_A = 25 °C, f_{OSC} = 12 MHz (crystal), f_{SYS} = 72 MHz, f_{BUS} = 72 MHz
3. Determined according to IEC Standard JESD78, *IC Latch-Up Test*

5.4.1 Thermal operating requirements

Table 11. Thermal operating requirements

Symbol	Description	Min.	Max.	Unit
T_J	Die junction temperature	-40	125	°C
T_A	Ambient temperature ¹	-40	105	°C

1. Maximum T_A can be exceeded only if the user ensures that T_J does not exceed maximum T_J . The simplest method to determine T_J is:

$$T_J = T_A + R_{\theta JA} \times \text{chip power dissipation}$$

5.4.2 Thermal attributes

Board type	Symbol	Description	256 MAPBGA	Unit	Notes
Single-layer (1s)	$R_{\theta JA}$	Thermal resistance, junction to ambient (natural convection)	43	°C/W	1, 2
Four-layer (2s2p)	$R_{\theta JA}$	Thermal resistance, junction to ambient (natural convection)	28	°C/W	1,2, 3
Single-layer (1s)	$R_{\theta JMA}$	Thermal resistance, junction to ambient (200 ft./min. air speed)	36	°C/W	1,3
Four-layer (2s2p)	$R_{\theta JMA}$	Thermal resistance, junction to ambient (200 ft./min. air speed)	25	°C/W	1,3
—	$R_{\theta JB}$	Thermal resistance, junction to board	17	°C/W	4
—	$R_{\theta JC}$	Thermal resistance, junction to case	8	°C/W	5
—	Ψ_{JT}	Thermal characterization parameter, junction to package top outside center (natural convection)	2	°C/W	6

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Determined according to JEDEC Standard JESD51-2, *Integrated Circuits Thermal Test Method Environmental Conditions – Natural Convection (Still Air)* with the single layer board horizontal. Board meets JESD51-9 specification.
3. Determined according to JEDEC Standard JESD51-6, *Integrated Circuits Thermal Test Method Environmental Conditions – Forced Convection (Moving Air)* with the board horizontal.
4. Determined according to JEDEC Standard JESD51-8, *Integrated Circuit Thermal Test Method Environmental Conditions – Junction-to-Board*. Board temperature is measured on the top surface of the board near the package.
5. Determined according to Method 1012.1 of MIL-STD 883, *Test Method Standard, Microcircuits*, with the cold plate temperature used for the case temperature. The value includes the thermal resistance of the interface material between the top of the package and the cold plate.
6. Determined according to JEDEC Standard JESD51-2, *Integrated Circuits Thermal Test Method Environmental Conditions – Natural Convection (Still Air)*.

5.5 Power sequencing

Voltage supplies must be sequenced in the proper order to avoid damaging internal diodes. There is no limit on how long after one supply powers up before the next supply must power up. Note that V_{DD} and V_{DD_INT} can use the same power source.

The power-up sequence is:

1. V_{DD}/V_{DDA}
2. V_{DD_INT}
3. V_{DD_DDR}

The power-down sequence is the reverse:

1. V_{DD_DDR}
2. V_{DD_INT}
3. V_{DD}/V_{DDA}

- This parameter is measured with the internal reference (slow clock) being used as a reference to the FLL (FEI clock mode).
- These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=0.
- The resulting system clock frequencies should not exceed their maximum specified values. The DCO frequency deviation (Δf_{dco_t}) over voltage and temperature should be considered.
- These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=1.
- The resulting clock frequency must not exceed the maximum specified clock frequency of the device.
- This specification applies to any time the FLL reference source or reference divider is changed, trim value is changed, DMX32 bit is changed, DRS bits are changed, or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
- Excludes any oscillator currents that are also consuming power while PLL is in operation.
- This specification applies to any time the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
- This specification was obtained using a Freescale developed PCB. PLL jitter is dependent on the noise characteristics of each PCB and results will vary.
- Accumulated jitter depends on VCO frequency and VDIV.

1. $V_{DD}=3.3$ V, Temperature =25 °C
2. See crystal or resonator manufacturer's recommendation
3. C_x and C_y can be provided by using either integrated capacitors or external components.
4. When low-power mode is selected, R_F is integrated and must not be attached externally.
5. The EXTAL and XTAL pins should only be connected to required oscillator components and must not be connected to any other device.

	Crystal startup time — 8 MHz high-frequency (MCG_C2[RANGE]=01), high-gain mode (HGO=1)	—	1	—	ms	

1. Frequencies less than 8 MHz are not in the PLL range.
2. Other frequency limits may apply when external clock is being used as a reference for the FLL or PLL.
3. When transitioning from FEI or FBI to FBE mode, restrict the frequency of the input clock so that, when it is divided by FRDIV, it remains within the limits of the DCO input clock frequency.

Peripheral operating requirements and behaviors

- Proper PC board layout procedures must be followed to achieve specifications.
- Crystal startup time is defined as the time between the oscillator being enabled and the OSCINIT bit in the MCG_S register being set.

NOTE

The 32 kHz oscillator works in low power mode by default and cannot be moved into high power/gain mode.

6.3.3 32 kHz oscillator electrical characteristics

t_{start}	Crystal start-up time	—	1000	—	ms	1
$V_{ec_extal32}$	Externally provided input clock amplitude	700	—	V_{BAT}	mV	2, 3

- Proper PC board layout procedures must be followed to achieve specifications.
- This specification is for an externally supplied clock driven to EXTAL32 and does not apply to any other clock input. The oscillator remains enabled and XTAL32 must be left unconnected.
- The parameter specified is a peak-to-peak value and V_{IH} and V_{IL} specifications do not apply. The voltage of the applied clock must be within the range of V_{SS} to V_{BAT} .

1. Typical data retention values are based on measured response accelerated at high temperature and derated to a constant 25°C use profile. Engineering Bulletin EB618 does not apply to this technology. Typical endurance defined in Engineering Bulletin EB619.
2. Cycling endurance represents number of program/erase cycles at $-40^{\circ}\text{C} \leq T_j \leq 125^{\circ}\text{C}$.
3. Write endurance represents the number of writes to each FlexRAM location at $-40^{\circ}\text{C} \leq T_j \leq 125^{\circ}\text{C}$ influenced by the cycling endurance of the FlexNVM and the allocated EEPROM backup per subsystem. Minimum and typical values assume all 16-bit or 32-bit writes to FlexRAM; all 8-bit writes result in 50% less endurance.

6.4.1.5 Write endurance to FlexRAM for EEPROM

When the FlexNVM partition code is not set to full data flash, the EEPROM data set size can be set to any of several non-zero values.

The bytes not assigned to data flash via the FlexNVM partition code are used by the FTFE to obtain an effective endurance increase for the EEPROM data. The built-in EEPROM record management system raises the number of program/erase cycles that can be attained prior to device wear-out by cycling the EEPROM data through a larger EEPROM NVM storage space.

While different partitions of the FlexNVM are available, the intention is that a single choice for the FlexNVM partition code and EEPROM data set size is used throughout the entire lifetime of a given application. The EEPROM endurance equation and graph shown below assume that only one configuration is ever used.

$$\text{Writes_subsystem} = \frac{\text{EEPROM} - 2 \times \text{EESPLIT} \times \text{EESIZE}}{\text{EESPLIT} \times \text{EESIZE}} \times \text{Write_efficiency} \times n_{\text{nvmcycee}}$$

where

- Writes_subsystem — minimum number of writes to each FlexRAM location for subsystem (each subsystem can have different endurance)
- EEPROM — allocated FlexNVM for each EEPROM subsystem based on DEPART; entered with the Program Partition command
- EESPLIT — FlexRAM split factor for subsystem; entered with the Program Partition command
- EESIZE — allocated FlexRAM based on DEPART; entered with the Program Partition command
- Write_efficiency —
 - 0.25 for 8-bit writes to FlexRAM
 - 0.50 for 16-bit or 32-bit writes to FlexRAM
- n_{nvmcycee} — EEPROM-backup cycling endurance

6.4.3 NAND flash controller specifications

The NAND flash controller (NFC) implements the interface to standard NAND flash memory devices. This section describes the timing parameters of the NFC.

In the following table:

- T_H is the flash clock high time and
- T_L is flash clock low time,

which are defined as:

$$T_{NFC} = T_L + T_H = \frac{T_{input\ clock}}{SCALER}$$

The SCALER value is derived from the fractional divider specified in the SIM's CLKDIV4 register:

$$SCALER = \frac{SIM_CLKDIV4[NFCFRAC] + 1}{SIM_CLKDIV4[NFCDIV] + 1}$$

In case the reciprocal of SCALER is an integer, the duty cycle of NFC clock is 50%, means $T_H = T_L$. In case the reciprocal of SCALER is not an integer:

$$T_L = (1 + SCALER / 2) \times \frac{T_{NFC}}{2}$$

$$T_H = (1 - \text{SCALER} / 2) \times \frac{T_{\text{NFC}}}{2}$$

For example, if SCALER is 0.2, then $T_H = T_L = T_{\text{NFC}}/2$.

However, if SCALER is 0.667, then $T_L = 2/3 \times T_{\text{NFC}}$ and $T_H = 1/3 \times T_{\text{NFC}}$.

NOTE

The reciprocal of SCALER must be a multiple of 0.5. For example, 1, 1.5, 2, 2.5, etc.

1. This is minimum frequency of operation according to JEDEC DDR2 specification.
2. DDR data rate = 2 x DDR clock frequency
3. Pulse width high plus pulse width low cannot exceed min and max clock period.
4. Command output setup should be 1/2 the memory bus clock (t_{DDRCK}) plus some minor adjustments for process, temperature, and voltage variations.
5. This specification relates to the required input setup time of DDR memories. The microprocessor's output setup should be larger than the input setup of the DDR memories. If it is not larger, then the input setup on the memory is in violation. DDR_DQ[15:8] is relative to DDR_DQS[1]; DDR_DQ[7:0] is relative to DDR_DQS[0].
6. The first data beat is valid before the first rising edge of DQS and after the DQS write preamble. The remaining data beats are valid for each subsequent DQS edge.
7. This specification relates to the required hold time of DDR memories. DDR_DQ[15:8] is relative to DDR_DQS[1]; DDR_DQ[7:0] is relative to DDR_DQS[0].
8. Data input skew is derived from each DQS clock edge. It begins with a DQS transition and ends when the last data line becomes valid. This input skew must include DDR memory output skew and system level board skew (due to routing or other factors).

6.4.5 Flexbus switching specifications

All processor bus timings are synchronous; input setup/hold and output delay are given in respect to the rising edge of a reference clock, FB_CLK. The FB_CLK frequency may be the same as the internal system bus frequency or an integer divider of that frequency.

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the Flexbus output clock (FB_CLK). All other timing relationships can be derived from these values.

6.6 Analog

6.6.1 ADC electrical specifications

The 16-bit accuracy specifications listed in [Table 29](#) and [Table 30](#) are achievable on the differential pins ADCx_DP0, ADCx_DM0.

The ADCx_DP2 and ADCx_DM2 ADC inputs are connected to the PGA outputs and are not direct device pins. Accuracy specifications for these pins are defined in [Table 31](#) and [Table 32](#).

All other ADC channels meet the 13-bit differential/12-bit single-ended accuracy specifications.

2. DC potential difference.
3. This resistance is external to MCU. To achieve the best results, the analog source resistance must be kept as low as possible. The results in this data sheet were derived from a system that had $< 8\ \Omega$ analog source resistance. The R_{AS}/C_{AS} time constant should be kept to $< 1\text{ ns}$.
4. To use the maximum ADC conversion clock frequency, $CFG2[ADHSC]$ must be set and $CFG1[ADLPC]$ must be clear.

2. ADC must be configured to use the internal voltage reference (VREF_OUT)
3. PGA reference is internally connected to the VREF_OUT pin. If the user wishes to drive VREF_OUT with a voltage other than the output of the VREF module, the VREF module must be disabled.
4. For single ended configurations the input impedance of the driven input is $R_{\text{PGAD}}/2$
5. The analog source resistance (R_{AS}), external to MCU, should be kept as minimum as possible. Increased R_{AS} causes drop in PGA gain without affecting other performances. This is not dependent on ADC clock frequency.
6. The minimum sampling time is dependent on input signal frequency and ADC mode of operation. A minimum of $1.25\mu\text{s}$ time should be allowed for $F_{\text{in}}=4\text{ kHz}$ at 16-bit differential mode. Recommended ADC setting is: ADLSMP=1, ADLSTS=2 at 8 MHz ADC clock.

4. $Gain = 2^{PGA_G}$
5. After changing the PGA gain setting, a minimum of 2 ADC+PGA conversions should be ignored.
6. Limit the input signal swing so that the PGA does not saturate during operation. Input signal swing is dependent on the PGA reference voltage and gain setting.

6.8.2 USB electrical specifications

The USB electricals for the USB On-the-Go module conform to the standards documented by the Universal Serial Bus Implementers Forum. For the most up-to-date standards, visit usb.org.

NOTE

The MCGPLLCLK meets the USB jitter and signaling rate specifications for certification with the use of an external clock/crystal for both Device and Host modes.

The MCGFLLCLK does not meet the USB jitter or signaling rate specifications for certification.

Pulse width of spikes that must be suppressed by the input filter	t_{SP}	N/A	N/A	0	50	ns

1. The maximum SCL Clock Frequency in Fast mode with maximum bus loading can only be achieved when using a pin configured for high drive across the full voltage range and when using the a pin configured for low drive with $V_{DD} \geq 2.7 V$.
2. The master mode I²C deasserts ACK of an address byte simultaneously with the falling edge of SCL. If no slaves acknowledge this address byte, then a negative hold time can result, depending on the edge rates of the SDA and SCL lines.
3. The maximum $t_{HD}; DAT$ must be met only if the device does not stretch the LOW period (t_{LOW}) of the SCL signal.
4. Input signal Slew = 10 ns and Output Load = 50 pF
5. Set-up time in slave-transmitter mode is 1 IPBus clock period, if the TX FIFO is empty.
6. A Fast mode I²C bus device can be used in a Standard mode I²C bus system, but the requirement $t_{SU}; DAT \geq 250 ns$ must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a

Peripheral operating requirements and behaviors

device does stretch the LOW period of the SCL signal, then it must output the next data bit to the SDA line $t_{rmax} + t_{SU; DAT} = 1000 + 250 = 1250$ ns (according to the Standard mode I²C bus specification) before the SCL line is released.

7. C_b = total capacitance of the one bus line in pF.

6.8.12 I2S/SAI switching specifications

This section provides the AC timing for the I2S/SAI module in master mode (clocks are driven) and slave mode (clocks are input). All timing is given for noninverted serial clock polarity (TCR2[BCP] is 0, RCR2[BCP] is 0) and a noninverted frame sync (TCR4[FSP]

is 0, RCR4[FSP] is 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the bit clock signal (BCLK) and/or the frame sync (FS) signal shown in the following figures.

6.8.12.1 Normal Run, Wait and Stop mode performance over a limited operating voltage range

1. The TSI module is functional with capacitance values outside this range. However, optimal performance is not guaranteed.
2. Fixed external capacitance of 20 pF.
3. REFCHRG = 2, EXTCHRG=0.
4. REFCHRG = 0, EXTCHRG = 10.
5. $V_{DD} = 3.0\text{ V}$.
6. The programmable current source value is generated by multiplying the SCANC[REFCHRG] value and the base current.
7. The programmable current source value is generated by multiplying the SCANC[EXTCHRG] value and the base current.
8. Measured with a 5 pF electrode, reference oscillator frequency of 10 MHz, PS = 128, NSCN = 8; I_{ext} = 16.
9. Measured with a 20 pF electrode, reference oscillator frequency of 10 MHz, PS = 128, NSCN = 2; I_{ext} = 16.
10. Measured with a 20 pF electrode, reference oscillator frequency of 10 MHz, PS = 16, NSCN = 3; I_{ext} = 16.
11. Sensitivity defines the minimum capacitance change when a single count from the TSI module changes. Sensitivity depends on the configuration used. The documented values are provided as examples calculated for a specific configuration of operating conditions using the following equation: $(C_{ref} * I_{ext}) / (I_{ref} * PS * NSCN)$
The typical value is calculated with the following configuration:
 $I_{ext} = 6\ \mu\text{A}$ (EXTCHRG = 2), PS = 128, NSCN = 2, $I_{ref} = 16\ \mu\text{A}$ (REFCHRG = 7), $C_{ref} = 1.0\ \text{pF}$
The minimum value is calculated with the following configuration:
 $I_{ext} = 2\ \mu\text{A}$ (EXTCHRG = 0), PS = 128, NSCN = 32, $I_{ref} = 32\ \mu\text{A}$ (REFCHRG = 15), $C_{ref} = 0.5\ \text{pF}$
The highest possible sensitivity is the minimum value because it represents the smallest possible capacitance that can be measured by a single count.
12. Time to do one complete measurement of the electrode. Sensitivity resolution of 0.0133 pF, PS = 0, NSCN = 0, 1 electrode, EXTCHRG = 7.
13. REFCHRG=0, EXTCHRG=4, PS=7, NSCN=0F, LPSCNITV=F, LPO is selected (1 kHz), and fixed external capacitance of 20 pF. Data is captured with an average of 7 periods window.

Table 60. GLCD_LSCLK Timing

Num	Description	Min.	Max.	Unit
T1	GLCD_LSCLK Period	25	2000	ns
T2	Pixel data setup time	8	—	ns
T3	Pixel data up time	8	—	ns

NOTE

The pixel clock is equal to $GLCD_LSCLK / (PCD + 1)$. When it is in CSTN, TFT, or monochrome mode with bus width = 1, GLCD_LSCLK is equal to the pixel clock. When it is in monochrome with other bus width settings, GLCD_LSCLK is equal to the pixel clock divided by bus width. The polarity of GLCD_LSCLK and GLCD_D signals can also be programmed.

T6	End of GLCD_HSYNC to beginning to GLCD_OE	3	$HWAIT2 + 3$	Ts
T7	End of GLCD_OE to beginning of GLCD_HSYNC	1	$HWAIT1 + 1$	Ts

NOTE

- T_s is the GLCD_LSCLK period. GLCD_VSYNC, GLCD_HSYNC, and GLCD_OE can be programmed as active high or active low. In the preceding figure, all 3 signals are active low. GLCD_LSCLK can be programmed to be deactivated during the GLCD_VSYNC pulse or the GLCD_OE deasserted period. In the preceding figure, GLCD_LSCLK is always active.
- XMAX is defined in number of pixels in one line.

**Figure 48. Non-TFT Mode Panel Timing****Table 62. Non-TFT Mode Panel Timing**

Num	Description	Min.	Max.	Unit
T1	GLCD_HSYNC to GLCD_VSYNC delay	2	HWAIT2 + 2	Tpix
T2	GLCD_HSYNC pulse width	1	HWIDTH + 1	Tpix
T3	GLCD_VSYNC to GLCD_LSCLK	—	$0 \leq T3 \leq T_s$	—
T4	GLCD_LSCLK to GLCD_HSYNC	1	HWAIT1 + 1	Tpix

NOTE

T_s is the GLCD_LSCLK period while Tpix is the pixel clock period. GLCD_VSYNC, GLCD_HSYNC, and GLCD_LSCLK can be programmed as active high or active low. In the preceding figure, all these 3 signals are active high. When it is in CSTN mode or monochrome mode with bus width = 1, $T3 = Tpix = T_s$. When it is in monochrome mode with bus width = 2, 4 and 8, $T3 = 1, 2$ and 4 Tpix respectively.

8.3 K70 Pinouts

The below figure shows the pinout diagram for the devices supported by this document. Many signals may be multiplexed onto a single pin. To determine what signals can be used on which pin, see the previous section.

9 Revision History

The following table provides a revision history for this document.

Table 64. Revision History

Rev. No.	Date	Substantial Changes
3	3/2012	Initial public release
4	10/2012	Replaced TBDs throughout.
5	10/2013	<p>Changes for 4N96B mask set:</p> <ul style="list-style-type: none"> • Min VDD operating requirement specification updated to support operation down to 1.71V. <p>New specifications:</p> <ul style="list-style-type: none"> • Updated Vdd_dds min specification. • Added Vodpu specification. • Removed loz, loz_dds, and loz_tamper Hi-Z leakage specifications. They have been replaced by new lina, lind, and Zind specifications. • Fpll_ref_acc specification has been added. • I²C module was previously covered by the general switching specifications. To provide more detail on I²C operation a dedicated Inter-Integrated Circuit Interface (I²C) timing section has been added. <p>Modified specifications:</p> <ul style="list-style-type: none"> • Vref_dds max spec has been updated. • Tpor spec has been split into two specifications based on VDD slew rate. • Trd1allx and Trd1alln max have been updated. • 16-bit ADC Temp sensor slope and Temp sensor voltage (Vtemp25) have been modified. The typical values that were listed previously have been updated, and min and max specifications have been added. <p>Corrections:</p> <ul style="list-style-type: none"> • Some versions of the datasheets listed incorrect clock mode information in the "Diagram: Typical IDD_RUN operating behavior section." These errors have been corrected. • Fintf_ft specification was previously shown as a max value. It has been corrected to be shown as a typical value as originally intended. • Corrected DDR write and read timing diagrams to show the correct location of the Tcmv specification. • SDHC peripheral 50MHz high speed mode options were left out of the last datasheet. These have been added to the SDHC specifications section.
6	09/2015	<ul style="list-style-type: none"> • Updated Power Sequencing section • Added footnote to ambient temperature specification of Thermal Operating requirements • Updated the data and DQS waveforms in DDR read timing diagram • Removed "USB HS/LS/FS on-the-go controller with on-chip high speed transceiver" from features section • Updated Terminology and guidelines section • Updated the footnotes and the values of Power consumption operating behaviors table • Added Notes in USB electrical specification section • Updated I2C timing table
7	02/2018	<ul style="list-style-type: none"> • Updated maximum SDHC frequency in SDHC specifications • Added MDIO serial management timing specifications section in Ethernet Switching Specifications
