

INA229-Q1 SLYS024A – MAY 2020 – REVISED JUNE 2021

INA229-Q1 AEC-Q100, 85-V, 20-Bit, Ultra-Precise Power/Energy/Charge Monitor With SPI Interface

# 1 Features

- AEC-Q100 qualified for automotive applications:
   Temperature grade 1: -40°C to +125°C, T<sub>A</sub>
- Functional Safety-Capable
  - Documentation available to aid functional safety system design
- High-resolution, 20-bit delta-sigma ADC
- Current monitoring accuracy:
  - Offset voltage: ±1 µV (maximum)
  - Offset drift: ±0.01 µV/°C (maximum)
  - Gain error: ±0.05% (maximum)
  - Gain error drift: ±20 ppm/°C (maximum)
  - Common mode rejection: 154 dB (minimum)
- Power monitoring accuracy:
  - 0.5% full scale, -40°C to +125°C (maximum)
- Energy and charge accuracy:
  - 1.0% full scale (maximum)
- Fast alert response: 75 µs
- Wide common-mode range: -0.3 V to +85 V
- Bus voltage sense input: 0 V to 85 V
- Shunt full-scale differential range: ±163.84 mV / ±40.96 mV
- Input bias current: 2.5 nA (maximum)
- Temperature sensor: ±1°C (maximum at 25°C)
- · Programmable resistor temperature compensation
- Programmable conversion time and averaging
- 10-MHz SPI communication interface
- Operates from a 2.7-V to 5.5-V supply:
  - Operational current: 640 µA (typical)
  - Shutdown current: 5 µA (maximum)

# 2 Applications

- Automotive battery management systems
- EV / HEV mA KA sense applications
- DC/DC converters and power inverters
- ADAS domain controllers

# **3 Description**

The INA229-Q1 is an ultra-precise digital power monitor with a 20-bit delta-sigma ADC specifically designed for current-sensing applications. The device can measure a full-scale differential input of  $\pm 163.84$  mV or  $\pm 40.96$  mV across a resistive shunt sense element with common-mode voltage support from -0.3 V to +85 V.

The INA229-Q1 reports current, bus voltage, temperature, power, energy and charge accumulation while employing a precision  $\pm 0.5\%$  integrated oscillator, all while performing the needed calculations in the background. The integrated temperature sensor is  $\pm 1^{\circ}$ C accurate for die temperature measurement and is useful in monitoring the system ambient temperature.

The low offset and gain drift design of the INA229-Q1 allows the device to be used in precise systems that do not undergo multi-temperature calibration during manufacturing. Further, the very low offset voltage and noise allow for use in mA to kA sensing applications and provide a wide dynamic range without significant power dissipation losses on the sensing shunt element. The low input bias current of the device permits the use of larger currentsense resistors, thus providing accurate current measurements in the micro-amp range.

The device allows for selectable ADC conversion times from 50  $\mu$ s to 4.12 ms as well as sample averaging from 1x to 1024x, which further helps reduce the noise of the measured data.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
INA229-Q1	VSSOP (10)	3.00 mm × 3.00 mm

(1) For all available packages, see the package option addendum at the end of the data sheet.

# 7 Detailed Description

# 7.1 Overview

The INA229-Q1 device is a digital current sense amplifier with a 4-wire SPI digital interface. It measures shunt voltage, bus voltage and internal temperature while calculating current, power, energy and charge necessary for accurate decision making in precisely controlled systems. Programmable registers allow flexible configuration for measurement precision as well as continuous or triggered operation. Detailed register information is found in Section 7.6.

# 7.2 Functional Block Diagram

# 7.3 Feature Description

# 7.3.1 Versatile High Voltage Measurement Capability

The INA229-Q1 operates off a 2.7 V to 5.5 V supply but can measure voltage and current on rails as high as 85 V. The current is measured by sensing the voltage drop across a external shunt resistor at the IN+ and IN– pins. The input stage of the INA229-Q1 is designed such that the input common-mode voltage can be higher than the device supply voltage,  $V_S$ . The supported common-mode voltage range at the input pins is -0.3 V to +85 V, which makes the device well suited for both high-side and low-side current measurements. There are no special considerations for power-supply sequencing because the common-mode input range and device supply voltage are independent of each other; therefore, the bus voltage can be present with the supply voltage off, and vice-versa without damaging the device.

The device also measures the bus supply voltage through the V<sub>BUS</sub> pin and temperature through the integrated temperature sensor. The differential shunt voltage is measured between the IN+ and IN– pins, while the bus voltage is measured with respect to device ground. Monitored bus voltages can range from 0 V to 85 V, while monitored temperatures can range from -40 °C to +125 °C.

Shunt voltage, bus voltage, and temperature measurements are multiplexed internally to a single ADC as shown in Figure 7-1.

#### 7.3.2 Internal Measurement and Calculation Engine

The current and charge are calculated after a shunt voltage measurement, while the power and energy are calculated after a bus voltage measurement. Power and energy are calculated based on the previous current calculation and the latest bus voltage measurement. If the value loaded into the SHUNT\_CAL register is zero, the power, energy and charge values will be reported as zero.

The current, voltage, and temperature values are immediate results when the number of averages is set to one as shown in Figure 7-2. However, when averaging is used, each ADC measurement is an intermediate result which is stored in the corresponding averaging registers. Following every ADC sample, the newly-calculated values for current, voltage, and temperature are appended to their corresponding averaging registers until the set number of averages is achieved. After all of the samples have been measured the average current and voltage is determined, the power is calculated and the results are loaded to the corresponding output registers where they can then be read.

The energy and charge values are accumulated for each conversion cycle. Therefore the INA229-Q1 averaging function is not applied to these.

Calculations for power, charge and energy are performed in the background and do not add to the overall conversion time.

Figure 7-2. Power, Energy and Charge Calculation Scheme

## 7.3.3 Low Bias Current

The INA229-Q1 features very low input bias current which provides several benefits. The low input bias current of the INA229-Q1 reduces the current consumed by the device in both active and shutdown state. Another benefit of low bias current is that it allows the use of input filters to reject high-frequency noise before the signal is converted to digital data. In traditional digital current-sense amplifiers, the addition of input filters comes at the cost of reduced accuracy. However, as a result of the low bias current, the reduction in accuracy due to input filters is minimized. An additional benefit of low bias current is the ability to use a larger shunt resistor to accurately sense smaller currents. Use of a larger value for the shunt resistor allows the device to accurately monitor currents in the sub-mA range.

The bias current in the INA229-Q1 is the smallest when the sensed current is zero. As the current starts to increase, the differential voltage drop across the shunt resistor increases which results in an increase in the bias current as shown in Input Bias Current vs. Differential Input Voltage.

#### 7.3.4 High-Precision Delta-Sigma ADC

The integrated ADC is a high-performance, low-offset, low-drift, delta-sigma ADC designed to support bidirectional current flow at the shunt voltage measurement channel. The measured inputs are selected through the high-voltage input multiplexer to the ADC inputs as shown in Figure 7-1. The ADC architecture enables lower drift measurement across temperature and consistent offset measurements across the common-mode voltage, temperature, and power supply variations. A low-offset ADC is preferred in current sensing applications to provide a near 0-V offset voltage that maximizes the useful dynamic range of the system.

The INA229-Q1 can measure the shunt voltage, bus voltage, and die temperature, or a combination of any based on the selected MODE bits setting in the ADC\_CONFIG register. This permits selecting modes to convert

only the shunt voltage or bus voltage to further allow the user to configure the monitoring function to fit the specific application requirements. When no averaging is selected, once an ADC conversion is completed, the converted values are independently updated in their corresponding registers where they can be read through the digital interface at the time of conversion end. The conversion time for shunt voltage, bus voltage, and temperature inputs are set independently from 50 µs to 4.12ms depending on the values programmed in the ADC\_CONFIG register. Enabled measurement inputs are converted sequentially so the total time to convert all inputs depends on the conversion time for each input and the number of inputs enabled. When averaging is used, the intermediate values are subsequently stored in an averaging accumulator, and the conversion sequence repeats until the number of averages is reached. After all of the averaging has been completed, the final values are updated in the corresponding registers that can then be read. These values remain in the data output registers until they are replaced by the next fully completed conversion results. In this case, reading the data output registers does not affect a conversion in progress.

The ADC has two conversion modes—continuous and triggered—set by the MODE bits in ADC\_CONFIG register. In continuous-conversion mode, the ADC will continuously convert the input measurements and update the output registers as described above in an indefinite loop. In triggered-conversion mode, the ADC will convert the input measurements as described above, after which the ADC will go into shutdown mode until another single-shot trigger is generated by writing to the MODE bits. Writing the MODE bits will interrupt and restart triggered or continuous conversions that are in progress. Although the device can be read at any time, and the data from the last conversion remains available, the Conversion Ready flag (CNVRF bit in DIAG\_ALRT register) is provided to help coordinate triggered conversions. This bit is set after all conversions and averaging is completed.

The Conversion Ready flag (CNVRF) clears under these conditions:

- Writing to the ADC\_CONFIG register (except for selecting shutdown mode); or
- Reading the DIAG\_ALRT Register

While the INA229-Q1 device is used in either one of the conversion modes, a dedicated digital engine is calculating the current, power, charge and energy values in the background as described in Section 7.3.2. In triggered mode, the accumulation registers (ENERGY and CHARGE) are invalid, as the device does not keep track of elapsed time. For applications that need critical measurements in regards to accumulation of time for energy and charge measurements, the device must be configured to use continuous conversion mode, as the accumulated results are continuously updated and can provide true system representation of charge and energy consumption in a system. All of the calculations are performed in the background and do not contribute to conversion time.

For applications that must synchronize with other components in the system, the INA229-Q1 conversion can be delayed by programming the CONVDLY bits in CONFIG register in the range between 0 (no delay) and 510 ms. The resolution in programming the conversion delay is 2 ms. The conversion delay is set to 0 by default. Conversion delay can assist in measurement synchronization when multiple external devices are used for voltage or current monitoring purposes. In applications where an time aligned voltage and current measurements are needed, two devices can be used with the current measurement delayed such that the external voltage and current measurements will occur at approximately the same time. Keep in mind that even though the internal time base for the ADC is precise, synchronization will be lost over time due to internal and external time base mismatch.

## 7.3.4.1 Low Latency Digital Filter

The device integrates a low-pass digital filter that performs both decimation and filtering on the ADC output data, which helps with noise reduction. The digital filter is automatically adjusted for the different output data rates and always settles within one conversion cycle. The user has the flexibility to choose different output conversion time periods  $T_{CT}$  from 50 µs to 4.12 ms. With this configuration the first amplitude notch appears at the Nyquist frequency of the output signal which is determined by the selected conversion time period and defined as  $f_{NOTCH}$ = 1 / (2 x T<sub>CT</sub>). This means that the filter cut-off frequency will scale proportionally with the data output rate as described. ADC Frequency Response shows the filter response when the 1.052 ms conversion time period is selected.

## 7.3.4.2 Flexible Conversion Times and Averaging

ADC conversion times for shunt voltage, bus voltage and temperature can be set independently from 50 µs to 4.12 ms. The flexibility in conversion time allows for robust operation in a variety of noisy environments. The device also allows for programmable averaging times from a single conversion all the way to an average of 1024 conversions. The amount of averaging selected applies uniformly to all active measurement inputs. The ADC\_CONFIG register shown in Table 7-6 provides additional details on the supported conversion times and averaging modes. The INA229-Q1 effective resolution of the ADC can be increased by increasing the conversion time and increasing the number of averages. Figure 7-4 and Figure 7-5 shown below illustrate the effect of conversion time and averaging on a constant input signal.

Figure 7-5. Noise vs. Conversion Time (Averaging = 128)

Settings for the conversion time and number of conversions averaged impact the effective measurement resolution. For more detailed information on how averaging reduces noise and increases the effective number of bits (ENOB) see Section 8.1.3.

### 7.3.5 Shunt Resistor Drift Compensation

The INA229-Q1 device has an internal temperature sensor which can measure die temperature from -40 °C to +125 °C. The accuracy of the temperature sensor is ±2 °C across the operational temperature range. The temperature value is stored inside the DIETEMP register and can be read through the digital interface.

The device has the capability to utilize the temperature measurement to compensate for shunt resistor temperature variance. This feature can be enabled by setting the TEMPCOMP bit in the CONFIG register, while the SHUNT\_TEMPCO is the register that can be programmed to enter the temperature coefficient of the used shunt. The full scale value of the SHUNT\_TEMPCO register is 16384 ppm/°C. The temperature compensation is referenced to +25 °C . The shunt is always assumed to have a positive temperature coefficient and the temperature compensation follows Equation 1:

$$R_{ADJ} = R_{NOM} + \frac{R_{NOM} \times (DIETEMP - 25) \times SHUNT\_TEMPCO}{10^6}$$
(1)

### where

- R<sub>NOM</sub> is the nominal shunt resistance in Ohms at 25 °C.
- DIETEMP is the temperature value in the DIETEMP register in °C.
- SHUNT\_TEMPCO is the shunt temperature coefficient in ppm/°C.

When this feature is enabled and correctly programmed, the CURRENT register data is corrected by constantly monitoring the die temperature and becomes a function of temperature. The effectiveness of the compensation will depend on how well the resistor and the INA229-Q1 are thermally coupled since the die temperature of the INA229-Q1 is used for the compensation.

#### Note

**Warning:** If temperature compensation is enabled under some conditions, the calculated current result may be lower than the actual value. This condition typically occurs when there is a high value of shunt voltage ( >70% of full range), there is a shunt with high temperature-coefficient value ( >2000 ppm/°C), and there is a high temperature ( >100°C). Consider the example of constant current flowing through a high temperature coefficient shunt such that at lower temperatures the shunt voltage is in its upper range. As the temperature increases, the device will correctly report a constant current until the maximum shunt voltage is reached. As temperature continues to increase after the maximum shunt voltage is reached. As temperature currents. This is because the effective resistance calculated will continue to increase while the detected shunt voltage will remain constant due to the voltage exceeding the selected ADC range.

## 7.3.6 Integrated Precision Oscillator

The internal timebase of the device is provided by an internal oscillator that is trimmed to less than 0.5% tolerance at room temperature. The precision oscillator is the timing source for ADC conversions, as well as the time-count used for calculation of energy and charge. The digital filter response varies with conversion time; therefore, the precise clock ensures filter response and notch frequency consistency across temperature. On power up, the internal oscillator and ADC take roughly 300 µs to reach <1% error stability. Once the clock stabilizes, the ADC data output will be accurate to the electrical specifications provided in Section 6.

## 7.3.7 Multi-Alert Monitoring and Fault Detection

The INA229-Q1 includes a multipurpose, open-drain ALERT output pin that can be used to report multiple diagnostics or as an indicator that the ADC conversion is complete when the device is operating in both triggered and continuous conversion mode. The diagnostics listed in Table 7-1 are constantly monitored and can

be reported through the ALERT pin whenever the monitored output value crosses its associated out-of-range threshold.

		•	
INA229-Q1 DIAGNOSTIC	STATUS BIT IN DIAG_ALRT REGISTER (RO)	OUT-OF-RANGE THRESHOLD REGISTER (R/W)	REGISTER DEFAULT VALUE
Shunt Under Voltage Limit	SHNTUL	SUVL	0x8000 h (two's complement)
Shunt Over Voltage Limit	SHNTOL	SOVL	0x7FFF h (two's complement)
Bus Voltage Over-Limit	BUSOL	BOVL	0x7FFF h (two's complement, positive values only)
Bus Voltage Under-Limit	BUSUL	BUVL	0x0000 h (two's complement, positive values only)
Temperature Over-Limit	TMPOL	TEMP_LIMIT	0xFFFF h (two's complement, positive values only)
Power Over-Limit	POL	PWR_LIMIT	0x7FFF h (two's complement)

### Table 7-1. ALERT Diagnostics Description

A read of the DIAG\_ALRT register is used to determine which diagnostic has triggered the ALERT pin. This register, shown in Table 7-16, is also used to monitor other associated diagnostics as well as configure some ALERT pin functions.

- Alert latch enable In case the ALERT pin is triggered, this function will hold the value of the pin even after all diagnostic conditions have cleared. A read of the DIAG\_ALRT register will reset the status of the ALERT pin. This function is enabled by setting the ALATCH bit.
- Conversion ready enable Enables the ALERT pin to assert when an ADC conversion has completed and output values are ready to be read through the digital interface. This function is enabled by setting the CNVR bit. The conversion completed events can also be read through the CNVRF bit regardless of the CNVR bit setting.
- Alert comparison on averaged output Allows the out-of-range threshold value to be compared to the averaged data values produced by the ADC. This helps to additionally remove noise from the output data when compared to the out-of-range threshold to avoid false alerts due to noise. However, the diagnostic will be delayed due to the time needed for averaging. This function is enabled by setting the SLOWALERT bit.
- Alert polarity Allows the device to invert the active state of the ALERT pin. Note that the ALERT pin is an
  open-drain output that must be pulled-up by a resistor. The ALERT pin is active-low by default and can be
  configured for active high function using the APOL control bit.

Other diagnostic functions that are not reported by the ALERT pin but are available by reading the DIAG\_ALRT register:

- Math overflow Indicated by the MATHOF bit, reports when an arithmetic operation has caused an internal register overflow.
- Memory status Indicated by the MEMSTAT bit, monitors the health of the device non-volatile trim memory. This bit should always read '1' when the device is operating properly.
- Energy overflow Indicated by the ENERGYOF bit, reports when the ENERGY register has reached an
  overflow state due to data accumulation.
- Charge overflow Indicated by the CHARGEOF bit, reports when the CHARGE register has reached an
  overflow state due to data accumulation.

When the ALERT pin is configured to report the ADC conversion complete event, the ALERT pin becomes a multipurpose reporting output. Figure 7-6 shows an example where the device reports ADC conversion complete events while the INA229-Q1 device is subject to shunt over voltage (over current) event, bus under voltage event, over temperature event and over power-limit event.

Figure 7-6. Multi-Alert Configuration

# 7.4 Device Functional Modes

### 7.4.1 Shutdown Mode

In addition to the two conversion modes (continuous and triggered), the device also has a shutdown mode (selected by the MODE bits in ADC\_CONFIG register) that reduces the quiescent current to less than 5  $\mu$ A and turns off current into the device inputs, reducing the impact of supply drain when the device is not being used. The registers of the device can be written to and read from while the device is in shutdown mode. The device remains in shutdown mode until another triggered conversion command or continuous conversion command is received.

The device can be triggered to perform conversions while in shutdown mode. When a conversion is triggered, the ADC will start conversion; once conversion completes the device will return to the shutdown state.

Note that the shutdown current is specified with an inactive communications bus. Active clock and data activity will increase the current consumption as a function of the bus frequency as shown in Shutdown  $I_Q$  vs. Clock Frequency.

#### 7.4.2 Power-On Reset

Power-on reset (POR) is asserted when  $V_S$  drops below 1.26V (typical) at which all of the registers are reset to their default values. A manual device reset can be initiated by setting the RST bit in the CONFIG register. The default power-up register values are shown in the reset column for each register description. Links to the register descriptions are shown in Section 7.6.

## 7.5 Programming

#### 7.5.1 Serial Interface

The primary communication between the INA229-Q1 and the external MCU is through the SPI bus, which provides full-duplex communications in a main-secondary configuration. The external MCU is always the primary or main SPI device, sending command requests on the MOSI pin, and receiving device responses on the MISO pin. The INA229-Q1 is always an SPI secondary device, receiving command requests and sending responses (status, measured values) to the external MCU over the MISO pin.

- SPI is a 4-pin interface with pins as:
  - CS SPI Chip Select (input)
  - SCLK SPI Clock (input)
  - MOSI SPI Secondary In / Main Out data (input)

- MISO SPI Secondary Out / Main In data (tri-state output)
- The SPI frame size is variable in length depending on the INA229-Q1 register accessed through the SPI interface as following:
  - Main to Secondary (MOSI): 6 bits for register Address; 1 bit low; 1 R/W bit (read / not write); variable length of low bits depending on the INA229-Q1 register length.
  - Secondary to Main (MISO): 8 bits low; variable length of bits depending on the INA229-Q1 register length.
- SPI bit-speed up to 10 Mbit/s
- Both Main commands and INA229-Q1 data are shifted MSB first, LSB last
- The data on the MOSI line is sampled on the falling edge of SCLK
- The data on the MISO line is shifted out on the rising edge of SCLK

The SPI communication starts with the CS falling edge, and ends with CS rising edge. The CS high level keeps secondary SPI interface in an idle state, and MISO output is tri-stated.

Since the MISO output is push-pull it is ideal to have the INA229-Q1 supply at the same voltage as the primary device I/O supply. If different supply voltages are used, level translation is recommended.

### 7.5.1.1 SPI Frame

SPI communication to the INA229-Q1 device is performed through register address access. Communication to every register starts with a 6-bit register address followed by a "0" and a R/W bit. Setting the R/W bit to "1" indicates that the current SPI frame will read from a device register while setting the R/W bit to "0" indicates the current SPI frame will write data to a device register.

Figure 7-8. SPI Write Frame

Note that while the read frame can be variable in length due to the different length registers in the INA229-Q1 device, the write frame is fixed in length as all writable registers are 16 bits wide. During an SPI write frame, while new data is shifted into the INA229-Q1 register, the old data from the same register is shifted out on the MISO line.

The first 8-bits of each SPI frame are presented in Table 7-2, which shows access to a certain register address on the MOSI line as well as read/write functionality. On an SPI read operation, the INA229-Q1 returns the data read in the same SPI frame.

Table 7-2. First 8-MSB Bits of SPI Frame

COMMAND	b7	b6	b5	b4	b3	b2	b1	b0
READ		ADDR4	ADDR3	ADDR2	ADDR1	ADDR0	0	1
WRITE	ADDR5	ADDR4	ADDR3	ADDR2	ADDRT	ADDRU	0	0

## 7.6 Register Maps

# 7.6.1 INA229-Q1 Registers

Table 7-3 lists the INA229-Q1 registers. All register locations not listed in Table 7-3 should be considered as reserved locations and the register contents should not be modified.

Address	Acronym	Register Name	Register Size (bits)	Section
0h	CONFIG	Configuration	16	Go
1h	ADC_CONFIG	ADC Configuration	16	Go
2h	SHUNT_CAL	Shunt Calibration	16	Go
3h	SHUNT_TEMPCO	Shunt Temperature Coefficient	16	Go
4h	VSHUNT	Shunt Voltage Measurement	24	Go
5h	VBUS	Bus Voltage Measurement	24	Go
6h	DIETEMP	Temperature Measurement	16	Go
7h	CURRENT	Current Result	24	Go
8h	POWER	Power Result	24	Go
9h	ENERGY	Energy Result	40	Go
Ah	CHARGE	Charge Result	40	Go
Bh	DIAG_ALRT	Diagnostic Flags and Alert	16	Go
Ch	SOVL	Shunt Overvoltage Threshold	16	Go
Dh	SUVL	Shunt Undervoltage Threshold	16	Go
Eh	BOVL	Bus Overvoltage Threshold	16	Go
Fh	BUVL	Bus Undervoltage Threshold	16	Go
10h	TEMP_LIMIT	Temperature Over-Limit Threshold	16	Go
11h	PWR_LIMIT	Power Over-Limit Threshold	16	Go
3Eh	MANUFACTURER_ID	Manufacturer ID	16	Go
3Fh	DEVICE_ID	Device ID	16	Go

Complex bit access types are encoded to fit into small table cells. Table 7-4 shows the codes that are used for access types in this section.

Access Type	Code	Description				
Read Type						
R	R	Read				
Write Type						
W	W	Write				
Reset or Default Value						
-n		Value after reset or the default value				

### Table 7-4. INA229-Q1 Access Type Codes

## 7.6.1.1 Configuration (CONFIG) Register (Address = 0h) [reset = 0h]

The CONFIG register is shown in Table 7-5.

# Return to the Summary Table.

Bit	Field	Туре	Reset	Description
15	RST	R/W	Oh	Reset Bit. Setting this bit to '1' generates a system reset that is the same as power-on reset. Resets all registers to default values. Oh = Normal Operation 1h = System Reset sets registers to default values This bit self-clears.
14	RSTACC	R/W	0h	Resets the contents of accumulation registers ENERGY and CHARGE to 0 0h = Normal Operation 1h = Clears registers to default values for ENERGY and CHARGE registers
13-6	CONVDLY	R/W	Oh	Sets the Delay for initial ADC conversion in steps of 2 ms. 0h = 0 s 1h = 2 ms FFh = 510 ms
5	TEMPCOMP	R/W	Oh	Enables temperature compensation of an external shunt 0h = Shunt Temperature Compensation Disabled 1h = Shunt Temperature Compensation Enabled
4	ADCRANGE	R/W	Oh	Shunt full scale range selection across IN+ and IN–. $0h = \pm 163.84 \text{ mV}$ $1h = \pm 40.96 \text{ mV}$
3-0	RESERVED	R	0h	Reserved. Always reads 0.

# 7.6.1.2 ADC Configuration (ADC\_CONFIG) Register (Address = 1h) [reset = FB68h]

The ADC\_CONFIG register is shown in Table 7-6.

Return to the Summary Table.

Table 7-6. ADC_CONFIG Register Field Descriptions	Т	Table 7	-6. ADC	CONFIG	Register	<b>Field Des</b>	criptions	
---	---	---------	---------	--------	----------	------------------	-----------	--

Bit	Field	Туре	Reset	Description
15-12	MODE	R/W	Fh	The user can set the MODE bits for continuous or triggered mode on bus voltage, shunt voltage or temperature measurement. Oh = Shutdown 1h = Triggered bus voltage, single shot 2h = Triggered shunt voltage, single shot 3h = Triggered shunt voltage and bus voltage, single shot 4h = Triggered temperature, single shot 5h = Triggered temperature and bus voltage, single shot 6h = Triggered temperature and shunt voltage, single shot 7h = Triggered bus voltage, shunt voltage and temperature, single shot 8h = Shutdown 9h = Continuous bus voltage only Ah = Continuous shunt voltage only Bh = Continuous shunt and bus voltage Ch = Continuous temperature only Dh = Continuous bus voltage and temperature Eh = Continuous temperature and shunt voltage Fh = Continuous bus voltage, shunt voltage
11-9	VBUSCT	R/W	5h	Sets the conversion time of the bus voltage measurement: $0h = 50 \ \mu s$ $1h = 84 \ \mu s$ $2h = 150 \ \mu s$ $3h = 280 \ \mu s$ $4h = 540 \ \mu s$ $5h = 1052 \ \mu s$ $6h = 2074 \ \mu s$ $7h = 4120 \ \mu s$
8-6	VSHCT	R/W	5h	Sets the conversion time of the shunt voltage measurement: $0h = 50 \ \mu s$ $1h = 84 \ \mu s$ $2h = 150 \ \mu s$ $3h = 280 \ \mu s$ $4h = 540 \ \mu s$ $5h = 1052 \ \mu s$ $6h = 2074 \ \mu s$ $7h = 4120 \ \mu s$
5-3	VTCT	R/W	5h	Sets the conversion time of the temperature measurement: $0h = 50 \ \mu s$ $1h = 84 \ \mu s$ $2h = 150 \ \mu s$ $3h = 280 \ \mu s$ $4h = 540 \ \mu s$ $5h = 1052 \ \mu s$ $6h = 2074 \ \mu s$ $7h = 4120 \ \mu s$

		<u></u>	ie negiote

# Table 7-6. ADC\_CONFIG Register Field Descriptions (continued)

# 7.6.1.3 Shunt Calibration (SHUNT\_CAL) Register (Address = 2h) [reset = 1000h]

The SHUNT\_CAL register is shown in Table 7-7.

Return to the Summary Table.

Table 7-7. SHUNT_CAL Register Field Descriptions	
--	--

Bit	Field	Туре	Reset	Description
15	RESERVED	R	0h	Reserved. Always reads 0.
14-0	SHUNT_CAL	R/W	1000h	The register provides the device with a conversion constant value that represents shunt resistance used to calculate current value in Amperes. This also sets the resolution for the CURRENT register. Value calculation under Section 8.1.2.

# 7.6.1.4 Shunt Temperature Coefficient (SHUNT\_TEMPCO) Register (Address = 3h) [reset = 0h]

The SHUNT\_TEMPCO register is shown in Table 7-8.

Return to the Summary Table.

## Table 7-8. SHUNT\_TEMPCO Register Field Descriptions

Bit	Field	Туре	Reset	Description
15-14	RESERVED	R	0h	Reserved. Always reads 0.
13-0	TEMPCO	R/W	0h	Temperature coefficient of the shunt for temperature compensation correction. Calculated with respect to +25 °C. The full scale value of the register is 16383 ppm/°C. The 16 bit register provides a resolution of 1ppm/°C/LSB 0h = 0 ppm/°C 3FFFh = 16383 ppm/°C

# 7.6.1.5 Shunt Voltage Measurement (VSHUNT) Register (Address = 4h) [reset = 0h]

The VSHUNT register is shown in Table 7-9.

Return to the Summary Table.

	Table 7-9. VSHUNT Register Field Descriptions							
Bit	Field	Туре	Reset	Description				
23-4	VSHUNT	R	0h	Differential voltage measured across the shunt output. Two's complement value. Conversion factor: 312.5 nV/LSB when ADCRANGE = 0 78.125 nV/LSB when ADCRANGE = 1				
3-0	RESERVED	R	0h	Reserved. Always reads 0.				

# Table 7-9. VSHUNT Register Field Descriptions

# 7.6.1.6 Bus Voltage Measurement (VBUS) Register (Address = 5h) [reset = 0h]

The VBUS register is shown in Table 7-10.

Return to the Summary Table.

# Table 7-10. VBUS Register Field Descriptions

Bit	Field	Туре	Reset	Description
23-4	VBUS	R		Bus voltage output. Two's complement value, however always positive. Conversion factor: 195.3125 μV/LSB
3-0	RESERVED	R	0h	Reserved. Always reads 0.

## 7.6.1.7 Temperature Measurement (DIETEMP) Register (Address = 6h) [reset = 0h]

The DIETEMP register is shown in Table 7-11.

Return to the Summary Table.

### Table 7-11. DIETEMP Register Field Descriptions

Bit	Field	Туре	Reset	Description
15-0	DIETEMP	R	0h	Internal die temperature measurement. Two's complement value.
				Conversion factor: 7.8125 m°C/LSB

#### 7.6.1.8 Current Result (CURRENT) Register (Address = 7h) [reset = 0h]

The CURRENT register is shown in Table 7-12.

Return to the Summary Table.

#### Table 7-12. CURRENT Register Field Descriptions

Bit	Field	Туре	Reset	Description
23-4	CURRENT	R	0h	Calculated current output in Amperes. Two's complement value. Value description under Section 8.1.2.
3-0	RESERVED	R	0h	Reserved. Always reads 0.

### 7.6.1.9 Power Result (POWER) Register (Address = 8h) [reset = 0h]

The POWER register is shown in Table 7-13.

Return to the Summary Table.

#### Table 7-13. POWER Register Field Descriptions

Bit	Field	Туре	Reset	Description
23-0	POWER	R	0h	Calculated power output. Output value in watts. Unsigned representation. Positive value. Value description under Section 8.1.2.

# 7.6.1.10 Energy Result (ENERGY) Register (Address = 9h) [reset = 0h]

The ENERGY register is shown in Table 7-14.

Return to the Summary Table.

### Table 7-14. ENERGY Register Field Descriptions

Bit	Field	Туре	Reset	Description
39-0	ENERGY	R		Calculated energy output. Output value is in Joules.Unsigned representation. Positive value. Value description under Section 8.1.2.

## 7.6.1.11 Charge Result (CHARGE) Register (Address = Ah) [reset = 0h]

The CHARGE register is shown in Table 7-15.

Return to the Summary Table.

#### Table 7-15. CHARGE Register Field Descriptions

Bit	Field	Туре	Reset	Description
39-0	CHARGE	R	0h	Calculated charge output. Output value is in Coulombs.Two's complement value. Value description under Section 8.1.2.

# 7.6.1.12 Diagnostic Flags and Alert (DIAG\_ALRT) Register (Address = Bh) [reset = 0001h]

The DIAG\_ALRT register is shown in Table 7-16.

Return to the Summary Table.

### Table 7-16. DIAG\_ALRT Register Field Descriptions

Bit	Field	Туре	Reset	Description
15	ALATCH	R/W	Oh	<ul> <li>When the Alert Latch Enable bit is set to Transparent mode, the Alert pin and Flag bit reset to the idle state when the fault has been cleared.</li> <li>When the Alert Latch Enable bit is set to Latch mode, the Alert pin and Alert Flag bit remain active following a fault until the DIAG_ALRT Register has been read.</li> <li>Oh = Transparent</li> <li>1h = Latched</li> </ul>
14	CNVR	R/W	Oh	Setting this bit high configures the Alert pin to be asserted when the Conversion Ready Flag (bit 1) is asserted, indicating that a conversion cycle has completed. 0h = Disable conversion ready flag on ALERT pin 1h = Enables conversion ready flag on ALERT pin
13	SLOWALERT	R/W	Oh	<ul> <li>When enabled, ALERT function is asserted on the completed averaged value.</li> <li>This gives the flexibility to delay the ALERT until after the averaged value.</li> <li>Oh = ALERT comparison on non-averaged (ADC) value</li> <li>1h = ALERT comparison on averaged value</li> </ul>
12	APOL	R/W	Oh	Alert Polarity bit sets the Alert pin polarity. 0h = Normal (Active-low, open-drain) 1h = Inverted (active-high, open-drain )
11	ENERGYOF	R	Oh	This bit indicates the health of the ENERGY register. If the 40 bit ENERGY register has overflowed this bit is set to 1. 0h = Normal 1h = Overflow Clears when the ENERGY register is read.

# Table 7-16. DIAG\_ALRT Register Field Descriptions (continued)

Bit	Field	Туре	Reset	Description
10	CHARGEOF	R	Oh	This bit indicates the health of the CHARGE register. If the 40 bit CHARGE register has overflowed this bit is set to 1. 0h = Normal
				1h = Overflow Clears when the CHARGE register is read.
9	MATHOF	R	Oh	This bit is set to 1 if an arithmetic operation resulted in an overflow error. It indicates that current and power data may be invalid. 0h = Normal
				1h = Overflow Must be manually cleared by triggering another conversion or by
				clearing the accumulators with the RSTACC bit.
8	RESERVED	R	0h	Reserved. Always read 0.
7	TMPOL	R/W	0h	This bit is set to 1 if the temperature measurement exceeds the threshold limit in the temperature over-limit register. 0h = Normal
				1h = Over Temp Event When ALATCH =1 this bit is cleared by reading this register.
6	SHNTOL	R/W	Oh	This bit is set to 1 if the shunt voltage measurement exceeds the threshold limit in the shunt over-limit register.
				0h = Normal 1h = Over Shunt Voltage Event When ALATCH =1 this bit is cleared by reading this register.
5	SHNTUL	R/W	Oh	This bit is set to 1 if the shunt voltage measurement falls below the threshold limit in the shunt under-limit register. Oh = Normal
				1h = Under Shunt Voltage Event When ALATCH =1 this bit is cleared by reading this register.
4	BUSOL	R/W	Oh	This bit is set to 1 if the bus voltage measurement exceeds the threshold limit in the bus over-limit register. 0h = Normal
				1h = Bus Over-Limit Event When ALATCH =1 this bit is cleared by reading this register.
3	BUSUL	R/W	0h	This bit is set to 1 if the bus voltage measurement falls below the threshold limit in the bus under-limit register. 0h = Normal
				1h = Bus Under-Limit Event When ALATCH =1 this bit is cleared by reading this register.
2	POL	R/W	0h	This bit is set to 1 if the power measurement exceeds the threshold limit in the power limit register. 0h = Normal
				1h = Power Over-Limit Event When ALATCH =1 this bit is cleared by reading this register.
1	CNVRF	R/W	Oh	This bit is set to 1 if the conversion is completed. 0h = Normal
				1h = Conversion is complete When ALATCH =1 this bit is cleared by reading this register or starting a new triggered conversion.
0	MEMSTAT	R/W	1h	This bit is set to 0 if a checksum error is detected in the device trim memory space. 0h = Memory Checksum Error
				1h = Normal Operation

# 7.6.1.13 Shunt Overvoltage Threshold (SOVL) Register (Address = Ch) [reset = 7FFFh]

If negative values are entered in this register, then a shunt voltage measurement of 0 V will trip this alarm. When using negative values for the shunt under and overvoltage thresholds be aware that the over voltage threshold must be set to the larger (that is, less negative) of the two values. The SOVL register is shown in Table 7-17.

Return to the Summary Table.

#### Table 7-17. SOVL Register Field Descriptions

Bit	Field	Туре	Reset	Description
15-0	SOVL	R/W	7FFFh	Sets the threshold for comparison of the value to detect Shunt Overvoltage (overcurrent protection). Two's complement value. Conversion Factor: 5 $\mu$ V/LSB when ADCRANGE = 0 1.25 $\mu$ V/LSB when ADCRANGE = 1.

## 7.6.1.14 Shunt Undervoltage Threshold (SUVL) Register (Address = Dh) [reset = 8000h]

The SUVL register is shown in Table 7-18.

Return to the Summary Table.

### Table 7-18. SUVL Register Field Descriptions

Bit	Field	Туре	Reset	Description
15-0	SUVL	R/W	8000h	Sets the threshold for comparison of the value to detect Shunt Undervoltage (undercurrent protection). Two's complement value. Conversion Factor: $5 \mu$ V/LSB when ADCRANGE = 0 1.25 $\mu$ V/LSB when ADCRANGE = 1.

# 7.6.1.15 Bus Overvoltage Threshold (BOVL) Register (Address = Eh) [reset = 7FFFh]

The BOVL register is shown in Table 7-19.

Return to the Summary Table.

#### Table 7-19. BOVL Register Field Descriptions

Bit	Field	Туре	Reset	Description
15	Reserved	R	0h	Reserved. Always reads 0.
14-0	BOVL	R/W		Sets the threshold for comparison of the value to detect Bus Overvoltage (overvoltage protection). Unsigned representation, positive value only. Conversion factor: 3.125 mV/LSB.

## 7.6.1.16 Bus Undervoltage Threshold (BUVL) Register (Address = Fh) [reset = 0h]

The BUVL register is shown in Table 7-20.

Return to the Summary Table.

#### Table 7-20. BUVL Register Field Descriptions

Bit	Field	Туре	Reset	Description
15	Reserved	R	0h	Reserved. Always reads 0.
14-0	BUVL	R/W	0h	Sets the threshold for comparison of the value to detect Bus Undervoltage (undervoltage protection). Unsigned representation, positive value only. Conversion factor: 3.125 mV/LSB.

## 7.6.1.17 Temperature Over-Limit Threshold (TEMP\_LIMIT) Register (Address = 10h) [reset = 7FFh]

The TEMP\_LIMIT register is shown in Table 7-21.

Return to the Summary Table.

#### Table 7-21. TEMP\_LIMIT Register Field Descriptions

Bit	Field	Туре	Reset	Description
15-0	TOL	R/W		Sets the threshold for comparison of the value to detect over temperature measurements. Two's complement value. The value entered in this field compares directly against the value from the DIETEMP register to determine if an over temperature condition exists. Conversion factor: 7.8125 m°C/LSB.

### 7.6.1.18 Power Over-Limit Threshold (PWR\_LIMIT) Register (Address = 11h) [reset = FFFFh]

The PWR\_LIMIT register is shown in Table 7-22.

Return to the Summary Table.

#### Table 7-22. PWR\_LIMIT Register Field Descriptions

Bit	Field	Туре	Reset	Description
15-0	POL	R/W		Sets the threshold for comparison of the value to detect power over- limit measurements. Unsigned representation, positive value only. The value entered in this field compares directly against the value from the POWER register to determine if an over power condition exists. Conversion factor: 256 × Power LSB.

### 7.6.1.19 Manufacturer ID (MANUFACTURER\_ID) Register (Address = 3Eh) [reset = 5449h]

The MANUFACTURER\_ID register is shown in Table 7-23.

Return to the Summary Table.

#### Table 7-23. MANUFACTURER\_ID Register Field Descriptions

Bit	Field	Туре	Reset	Description
15-0	MANFID	R	5449h	Reads back TI in ASCII.

#### 7.6.1.20 Device ID (DEVICE\_ID) Register (Address = 3Fh) [reset = 2291h]

The DEVICE\_ID register is shown in Table 7-24.

Return to the Summary Table.

#### Table 7-24. DEVICE\_ID Register Field Descriptions

Bit	Field	Туре	Reset	Description
15-4	DIEID	R	229h	Stores the device identification bits.
3-0	REV_ID	R	1h	Device revision identification.

# 8 Application and Implementation

#### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

## 8.1 Application Information

### 8.1.1 Device Measurement Range and Resolution

The INA229-Q1 device supports two input ranges for the shunt voltage measurement. The supported full scale differential input across the IN+ and IN– pins can be either  $\pm 163.84$  mV or  $\pm 40.96$  mV depending on the ADCRANGE bit in CONFIG register. The range for the bus voltage measurement is from 0 V to 85 V. The internal die temperature sensor range extends from -256 °C to +256 °C but is limited by the package to -40 °C to 125 °C.

Table 8-1 provides a description of full scale voltage on shunt, bus, and temperature measurements, along with their associated step size.

PARAMETER	FULL SCALE VALUE	RESOLUTION
Shunt voltage	±163.84 mV (ADCRANGE = 0)	312.5 nV/LSB
Shuhi voltage	±40.96 mV (ADCRANGE = 1)	78.125 nV/LSB
Bus voltage	0 V to 85 V	195.3125 μV/LSB
Temperature	–40 °C to +125 °C	7.8125 m°C/LSB

#### Table 8-1. ADC Full Scale Values

The device shunt voltage measurements, bus voltage, and temperature measurements can be read through the VSHUNT, VBUS, and DIETEMP registers, respectively. The digital output in VSHUNT and VBUS registers is 20-bits. The shunt voltage measurement can be positive or negative due to bidirectional currents in the system; therefore the data value in VSHUNT can be positive or negative. The VBUS data value is always positive. The output data can be directly converted into voltage by multiplying the digital value by its respective resolution size. The digital output in the DIETEMP register is 16-bit and can be directly converted to °C by multiplying by the above resolution size. This output value can also be positive or negative.

Furthermore, the device provides the flexibility to report calculated current in Amperes, power in Watts, charge in Coulombs and energy in Joules as described in Section 8.1.2.

## 8.1.2 Current , Power, Energy, and Charge Calculations

For the INA229-Q1 device to report current values in Ampere units, a constant conversion value must be written in the SHUNT\_CAL register that is dependent on the maximum measured current and the shunt resistance used in the application. The SHUNT\_CAL register is calculated based on Equation 2. The term CURRENT\_LSB is the LSB step size for the CURRENT register where the current in Amperes is stored. The value of CURRENT\_LSB is based on the maximum expected current as shown in Equation 3, and it directly defines the resolution of the CURRENT register. While the smallest CURRENT\_LSB value yields highest resolution, it is common to select a higher round-number (no higher than 8x) value for the CURRENT\_LSB in order to simplify the conversion of the CURRENT.

(2)

(4)

(5)

The  $R_{SHUNT}$  term is the resistance value of the external shunt used to develop the differential voltage across the IN+ and IN- pins. Use Equation 2 for ADCRANGE = 0. For ADCRANGE = 1, the value of SHUNT\_CAL must be multiplied by 4.

where

- 13107.2 x 10<sup>6</sup> is an internal fixed value used to ensure scaling is maintained properly.
- the value of SHUNT\_CAL must be multiplied by 4 for ADCRANGE = 1.

$$CURRENT_LSB = \frac{Maximum Expected Current}{2^{19}}$$
(3)

Note that the current is calculated following a shunt voltage measurement based on the value set in the SHUNT\_CAL register. If the value loaded into the SHUNT\_CAL register is zero, the current value reported through the CURRENT register is also zero.

After programming the SHUNT\_CAL register with the calculated value, the measured current in Amperes can be read from the CURRENT register. The final value is scaled by CURRENT\_LSB and calculated in Equation 4:

where

• CURRENT is the value read from the CURRENT register

The power value can be read from the POWER register as a 24-bit value and converted to Watts by using Equation 5:

where

- POWER is the value read from the POWER register.
- CURRENT\_LSB is the lsb size of the current calculation as defined by Equation 3.

The energy value can be read from the ENERGY register as a 40-bit unsigned value in Joules units. The energy value in Joules is converted by using Equation 6:

Energy [J] = 16 x 3.2 x CURRENT\_LSB x ENERGY

(6)

The charge value can be read from the CHARGE register as a 40-bit, two's complement value in Coulombs. The charge value in Coulomb is converted by using Equation 7:

Charge [C] = CURRENT\_LSB x CHARGE

(7)

where

- CHARGE is the value read from the CHARGE register.
- CURRENT\_LSB is the lsb size of the current calculation as described in Equation 3.

Upon overflow, the ENERGY and CHARGE registers will roll over and start from zero. The register values can also be reset at any time by setting the RSTACC bit in the CONFIG register.

For a design example using these equations refer to Section 8.2.2.

#### 8.1.3 ADC Output Data Rate and Noise Performance

The INA229-Q1 noise performance and effective resolution depend on the ADC conversion time. The device also supports digital averaging which can further help decrease digital noise. The flexibility of the device to select ADC conversion time and data averaging offers increased signal-to-noise ratio and achieves the highest dynamic range with lowest offset. The profile of the noise at lower signals levels is dominated by the system noise that is comprised mainly of 1/f noise or white noise. The INA229-Q1 effective resolution of the ADC can be increased by increasing the conversion time and increasing the number of averages.

Table 8-2 summarizes the output data rate conversion settings supported by the device. The fastest conversion setting is 50 µs. Typical noise-free resolution is represented as Effective Number of Bits (ENOB) based on device measured data. The ENOB is calculated based on noise peak-to-peak values, which assures that full noise distribution is taken into consideration.

ADC CONVERSION TIME PERIOD [µs]	OUTPUT SAMPLE AVERAGING [SAMPLES]	OUTPUT SAMPLE PERIOD [ms]	NOISE-FREE ENOB (±163.84-mV) (ADCRANGE = 0)	NOISE-FREE ENOB (±40.96-mV) (ADCRANGE = 1)

### Table 8-2. INA229-Q1 Noise Performance (continued)

## 8.1.4 Input Filtering Considerations

As previously discussed, INA229-Q1 offers several options for noise filtering by allowing the user to select the conversion times and number of averages independently in the ADC\_CONFIG register. The conversion times can be set independently for the shunt voltage and bus voltage measurements to allow added flexibility in monitoring of the power-supply bus.

The internal ADC has good inherent noise rejection; however, the transients that occur at or very close to the sampling rate harmonics can cause problems. Because these signals are at 1 MHz and higher, they can be managed by incorporating filtering at the input of the device. Filtering high frequency signals enables the use of low-value series resistors on the filter with negligible effects on measurement accuracy. For best results, filter using the lowest possible series resistance (typically 100  $\Omega$  or less) and a ceramic capacitor. Recommended values for this capacitor are between 0.1  $\mu$ F and 1  $\mu$ F. Figure 8-1 shows the device with a filter added at the input.

Overload conditions are another consideration for the device inputs. The device inputs are specified to tolerate  $\pm$ 40 V differential across the IN+ and IN– pins. A large differential scenario might be a short to ground on the load side of the shunt. This type of event can result in full power-supply voltage across the shunt (as long the power supply or energy storage capacitors support it). Removing a short to ground can result in inductive kickbacks that could exceed the 40-V differential or 85-V common-mode absolute maximum rating of the device. Inductive kickback voltages are best controlled by Zener-type transient-absorbing devices (commonly called *transzorbs*) combined with sufficient energy storage capacitance. See the *Transient Robustness for Current Shunt Monitors* reference design which describes a high-side current shunt monitor used to measure the voltage developed across a current-sensing resistor when current passes through it.

In applications that do not have large energy storage, electrolytic capacitors on one or both sides of the shunt, an input overstress condition may result from an excessive dV/dt of the voltage applied to the input. A hard physical short is the most likely cause of this event. This problem occurs because an excessive dV/dt can activate the ESD protection in the device in systems where large currents are available. Testing demonstrates that the addition of  $10-\Omega$  resistors in series with each input of the device sufficiently protects the inputs against this dV/dt failure up to the 40-V maximum differential voltage rating of the device. Selecting these resistors in the range noted has minimal effect on accuracy.

Figure 8-1. Input Filtering

Do not use values greater than 100 ohms for R<sub>FILTER</sub>. Doing so will degrade gain error and increase non-linearity.

# 8.2 Typical Application

The low offset voltage and low input bias current of the INA229-Q1 allow accurate monitoring of a wide range of currents. To accurately monitor currents with high resolution, select the value of the shunt resistor so that the resulting sense voltage is close to the maximum allowable differential input voltage range (either  $\pm 163.84$  mV or  $\pm 40.96$  mV, depending on register settings). The circuit for monitoring currents in a high-side configuration is shown in Figure 8-2.

Figure 8-2. INA229-Q1 High-Side Sensing Application Diagram

## 8.2.1 Design Requirements

The INA229-Q1 measures the voltage developed across a current-sensing resistor ( $R_{SHUNT}$ ) when current passes through it. The device also measures the bus supply voltage and calculates power when calibrated. It also comes with alert capability, where the alert pin can be programmed to respond to a user-defined event or a conversion ready notification.

The design requirements for the circuit shown in Figure 8-2 are listed in Table 8-3.

DESIGN PARAMETER	EXAMPLE VALUE			
Power-supply voltage (V <sub>S</sub> )	5 V			
Bus supply rail (V <sub>CM</sub> )	48 V			
Bus supply rail over voltage fault threshold	52 V			
Average Current	6 A			
Overcurrent fault threshold (I <sub>MAX</sub> )	10 A			

### Table 8-3. Design Parameters

		Table 8-3.	Design	Parameters	(continued)	
--	--	------------	--------	------------	-------------	--

	DESIGN PARAMETER	EXAMPLE VALUE
	ADC Range Selection (V <sub>SENSE_MAX</sub> )	±163.84 mV
	Temperature	25 °C
	Charge Accumulation Period	1 hour

### 8.2.2 Detailed Design Procedure

#### 8.2.2.1 Select the Shunt Resistor

Using values from Table 8-3, the maximum value of the shunt resistor is calculated based on the value of the maximum current to be sensed ( $I_{MAX}$ ) and the maximum allowable sense voltage ( $V_{SENSE\_MAX}$ ) for the chosen ADC range. When operating at the maximum current, the differential input voltage must not exceed the maximum full scale range of the device,  $V_{SENSE\_MAX}$ . Using Equation 8 for the given design parameters, the maximum value for  $R_{SHUNT}$  is calculated to be 16.38 m $\Omega$ . The closest standard resistor value that is smaller than the maximum calculated value is 16.2 m $\Omega$ . Also keep in mind that  $R_{SHUNT}$  must be able to handle the power dissipated across it in the maximum load condition.

$$R_{SHUNT} < \frac{V_{SENSE\_MAX}}{I_{MAX}}$$
(8)

### 8.2.2.2 Configure the Device

The first step to program the INA229-Q1 is to properly set the device and ADC configuration registers. On initial power up the CONFIG and ADC\_CONFIG registers are set to the reset values as shown in Table 7-5 and Table 7-6. In this default power on state the device is set to measured on the  $\pm 163.84$  mV range with the ADC continuously converting the shunt voltage, bus voltage, and temperature. If the default power up conditions do not meet the design requirements, these registers will need to be set properly after each V<sub>S</sub> power cycle event.

#### 8.2.2.3 Program the Shunt Calibration Register

The shunt calibration register needs to be correctly programmed at each  $V_S$  power up in order for the device to properly report any result based on current. The first step in properly setting this register is to calculate the LSB value for the current by using Equation 3. Applying this equation with the maximum expected current of 10 A results in an LSB size of 19.0735  $\mu$ A. Applying Equation 2 to the Current\_LSB and selected value for the shunt resistor results in a shunt calibration register setting of 4050d (FD2h). Failure to set the value of the shunt calibration register will result in a zero value for any result based on current.

#### 8.2.2.4 Set Desired Fault Thresholds

Fault thresholds are set by programming the desired trip threshold into the corresponding fault register. The list of supported fault registers is shown in Table 7-1. Since the fault limit registers are 16 bits in length, the effective LSB size for these registers is 16 times greater than the corresponding 20 bit LSB used in calculating returned values for bus voltage and current.

An over current threshold is set by programming the shunt over voltage limit register (SOVL). The voltage that needs to be programmed into this register is calculated by multiplying the over current threshold by the shunt resistor. In this example the over current threshold is 10 A and the value of the current sense resistor is 16.2 m $\Omega$ , which give a shunt voltage limit of 162 mV. Once the shunt voltage limit is known, the value for the shunt over voltage limit register is calculated by dividing the shunt voltage limit by the shunt voltage LSB size.

In this example, the calculated value of the shunt over voltage limit register is  $162 \text{ mV} / (312.5 \text{ nV} \times 16) = 32400d (7E90h).$ 

An over voltage fault threshold on the bus voltage is set by programming the bus over voltage limit register (BOVL). In this example the desired over voltage threshold is 52 V. The value that needs to be programmed into this register is calculated by dividing the target threshold voltage by the bus voltage fault limit LSB value of 3.125 mV. For this example, the target value for the BOVL register is 52 V / (195.3125  $\mu$ V × 16) = 16640d (4100h).

When setting the power over-limit value, the LSB size used to calculate the value needed in the limit registers will be 256 times greater than the power LSB. This is because the power register is a 24 bits in length while the power fault limit register is 16 bits.

Values stored in the alert limit registers are set to the default values after V<sub>S</sub> power cycle events and need to be reprogrammed each time power is applied.

#### 8.2.2.5 Calculate Returned Values

Parametric values are calculated by multiplying the returned value by the LSB value. Table 8-4 below shows the returned values for this application example assuming the design requirements shown in Table 8-3.

PARAMETER	Returned Value	LSB Value	Calculated Value				
Shunt voltage (V)	311040d	312.5 nV/LSB	0.0972 V				
Current (A)	314572d	10 A/ 2 <sup>19</sup> = 19.073486 μA/LSB	6 A				
Bus voltage (V)	245760d	195.3125 μV/LSB	48 V				
Power (W)	4718604d	Current LSB x 3.2 = 61.035156 µW/LSB	288 W				
Energy (J)	1061683200d	Power LSB x 16 = 976.5625 μJ/LSB	1036800 J				
Charge (C)	1132462080d	Current LSB = 19.073486 µC/LSB	21600 C				
Temperature (°C)	3200d	7.8125 m°C/LSB	25°C				

Table	8-4.	Calculating	Returned	Values
Table	U- <del>-</del> .	oalculating	Returned	Values

Shunt Voltage, Current, Bus Voltage (positive only), Charge, and Temperature return values in two's complement format. In two's complement format a negative value in binary is represented by having a 1 in the most significant bit of the returned value. These values can be converted to decimal by first inverting all the bits and adding 1 to obtain the unsigned binary value. This value should then be converted to decimal with the negative sign applied. For example, assume a shunt voltage reading returns 1011 0100 0001 0000 0000. This is a negative value due to the MSB having a value of one. Inverting the bits and adding one results in 0100 1011 1111 0000 0000 (311040d) which from the shunt voltage example in Table 8-4 correlates to a voltage of 97.2 mV. Since the returned value was negative the measured shunt voltage value is -97.2 mV.

### 8.2.3 Application Curves

Figure 8-3 and Figure 8-4 show the ALERT pin response to a bus overvoltage fault with a conversion time of 50 µs, averaging set to 1, and the SLOWALERT bit set to 0 for bus only conversions. For these scope shots, persistence was enabled on the ALERT channel to show the variation in the alert response for many sequential fault events. If the magnitude of the fault is sufficient the ALERT response can be as fast as one quarter of the ADC conversion time as shown in Figure 8-3. For fault conditions that are just exceeding the limit threshold, the response time for the ALERT pin can vary from approximately 0.5 to 1.5 conversion cycles as shown in Figure 8-4. Variation in the alert response exists because the external fault event is not synchronized to the internal ADC conversion start. Also the ADC is constantly sampling to get a result, so the response time for fault events starting from zero will slower than fault events starting from values near the set fault threshold. Since the timing of the alert can be difficult to predict, applications where the alert timing is critical should assume a alert response equal to 1.5 times the ADC conversion time for bus voltage or shunt voltage only conversions.

### 9 Power Supply Recommendations

The input circuitry of the device can accurately measure signals on common-mode voltages beyond its powersupply voltage,  $V_S$ . For example, the voltage applied to the  $V_S$  power supply terminal can be 5 V, whereas the load power-supply voltage being monitored (the common-mode voltage) can be as high as 85 V. Note that the device can also withstand the full 0 V to 85 V range at the input terminals, regardless of whether the device has power applied or not. Avoid applications where the GND pin is disconnected while device is actively powered.

Place the required power-supply bypass capacitors as close as possible to the supply and ground terminals of the device. A typical value for this supply bypass capacitor is 0.1  $\mu$ F. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise.

### 10 Layout

### **10.1 Layout Guidelines**

Connect the input pins (IN+ and IN–) to the sensing resistor using a Kelvin connection or a 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is sensed between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current-sensing resistor, any additional high-current carrying impedance causes significant measurement errors. Place the power-supply bypass capacitor as close as possible to the supply and ground pins.

### **10.2 Layout Example**

(1) Connect the VBUS pin to the voltage powering the load for load power calculations..

(2) Can be left floating if unused.

#### 11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.5 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

### 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

### PACKAGING INFORMATION

Orderable part number	Status (1)	Material type	Package   Pins	Package qty   Carrier	<b>RoHS</b> (3)	Lead finish/ Ball material	MSL rating/ Peak reflow	Op temp (°C)	Part marking (6)
						(4)	(5)		
INA229AQDGSRQ1	Active	Production	VSSOP (DGS)   10	2500   LARGE T&R	Yes	SN	Level-2-260C-1 YEAR	-40 to 125	229Q
INA229AQDGSRQ1.A	Active	Production	VSSOP (DGS)   10	2500   LARGE T&R	Yes	SN	Level-2-260C-1 YEAR	-40 to 125	229Q

<sup>(1)</sup> **Status:** For more details on status, see our product life cycle.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

# **DGS0010A**

# **PACKAGE OUTLINE**

## VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M. 2. This drawing is subject to change without notice. 3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
- exceed 0.15 mm per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
- 5. Reference JEDEC registration MO-187, variation BA.

# DGS0010A

# **EXAMPLE BOARD LAYOUT**

## VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# DGS0010A

# **EXAMPLE STENCIL DESIGN**

## VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

NOTES: (continued)

9. Board assembly site may have different recommendations for stencil design.

<sup>8.</sup> Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
