### Application Notes

#### Input Fusing and Safety Considerations

The QSB15048W series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommended a 30 A fast acting fuse. It is recommended that the circuit has a transient voltage suppressor diode (TVS) across the input terminals to protect the unit against surge or spike voltages and input reverse voltage (as shown). A suitable part would be SMCJ78A.

#### Output Voltage Adjustment

The Trim input permits the user to adjust the output voltage up or down 10%. This is accomplished by connecting an external resistor between the Trim pin and either the Vout (+) pin or the Vout(-) pin (COM pin).

#### To Trim Down

Connecting an external resistor (Rd) between the Trim pin and the Vout (+) (or Sense (+)) pin decreases the output voltage. The following equations determine the required external resistor value to obtain a percentage output voltage change of  $\Delta\%$ .

$$V_{out} = 12 \text{ & } 15 \text{ V}$$

$$R_D = 20x \frac{(V_{o\_set} - \Delta \% \times V_{o\_set} - 1.24)}{\Delta \% \times V_{o\_set}} - 100 \text{ k}\Omega$$

$$V_{out} = 24 \text{ V}$$

$$R_D = 20x \frac{(V_{o\_set} - \Delta \% \times V_{o\_set} - 2.5)}{\Delta \% \times V_{o\_set}} - 100 \text{ k}\Omega$$

$$V_{out} = 28 \text{ V}$$

$$R_D = 23.7x \frac{(V_{o\_set} - \Delta \% \times V_{o\_set} - 2.5)}{\Delta \% \times V_{o\_set}} - 150 \text{ k}\Omega$$

$$V_{out} = 48 \text{ V}$$

$$R_D = 30x \frac{(V_{o\_set} - \Delta \% \times V_{o\_set} - 2.5)}{\Delta \% \times V_{o\_set}} - 200 \text{ k}\Omega$$

#### To Trim Up

Connecting an external resistor (Ru) between the Trim pin and the Vout (-) (or Sense (-)) pin increases the output voltage. The following equations determine the required external resistor value to obtain a percentage output voltage change of  $\Delta\%$ .

$$V_{out} = 12 \text{ V & } 15 \text{ V}$$

$$R_U = 20x \frac{\left(1.24 - \frac{0.46 \times 100}{100 + 4.3}\right)}{\Delta \% \times V_{o\_set}} - \frac{4.3 \times 100}{100 + 4.3} \text{ k}\Omega$$

$$V_{out} = 24 \text{ V}$$

$$R_U = 20x \frac{\left(2.5 - \frac{0.46 \times 100}{100 + 5.6}\right)}{\Delta \% \times V_{o\_set}} - \frac{5.6 \times 100}{100 + 5.6} \text{ k}\Omega$$

$$V_{out} = 28 \text{ V}$$

$$R_U = 23.7x \frac{\left(2.5 - \frac{0.46 \times 100}{100 + 5.6}\right)}{\Delta \% \times V_{o\_set}} - \frac{5.6 \times 150}{150 + 5.6} \text{ k}\Omega$$

$$V_{out} = 48 \text{ V}$$

$$R_U = 36x \frac{\left(2.5 - \frac{0.46 \times 200}{200 + 5.1}\right)}{\Delta \% \times V_{o\_set}} - \frac{5.1 \times 200}{200 + 5.1} \text{ k}\Omega$$

$$V_{out} = V_{o\_set} \Delta \% = \left( \frac{V_{required} - V_{o\_set}}{V_{o\_set}} \right) \times 100$$

Where

$$V_{out} = V_{o\_set} \Delta \% = \left( \frac{V_{set} - V_{required}}{V_{o\_set}} \right) \times 100$$

### Output Voltage Adjustment Examples

As an example, to trim-down the output voltage of 24 V module (QS15048WS24) by 5% to 22.8 V, Rd resistor is calculated as follows:  $\Delta\% = 5\%$

$$R_D = 20x \frac{(24 - 5\% \times 24 - 2.5)}{5\% \times 24} - 100 \text{ k}\Omega$$

$$R_D = 238.3 \text{ k}\Omega$$

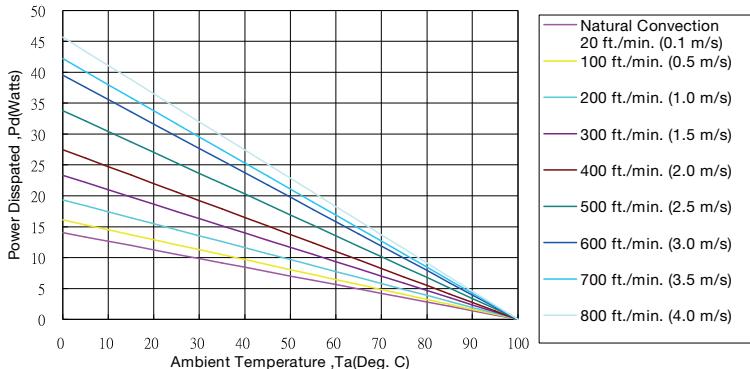

And, to trim-up the output voltage of 24 V module (QS15048WS24) by 5% to 25.2 V, Ru resistor is calculated as follows:  $\Delta\% = 5\%$

$$R_U = 20x \frac{(2.5 - \frac{0.46 \times 100}{100 + 5.6})}{5\% \times 24} - \frac{5.6 \times 100}{100 + 5.6} \text{ k}\Omega$$

$$R_U = 29.1 \text{ k}\Omega$$

### Airflow Derating Graph

#### Example (Without Heatsink)

To determine the minimum airflow necessary for a QS15048WS24 operating at an input voltage of 36 V, an output current of 6.25 A, and a maximum ambient temperature of 30°C:

Determine Power dissipation (Pd):  $P_d = P_i - P_o = P_o(1 - \eta)/\eta$ ,

$$P_d = 24 \text{ V} \times 6.25 \text{ A} \times (1 - 0.895)/0.895 = 17.6 \text{ Watts}$$

Where  $P_i$  = Input power,  $P_o$  = Output Power and  $\eta$  = Efficiency

Determine airflow from airflow derating graph using data points for  $P_d=19.5$  W and  $T_a = 30$  °C

Minimum airflow= 400 ft./min.

To check that the maximum case temp of 100 °C is not exceeded:

Maximum temperature rise is

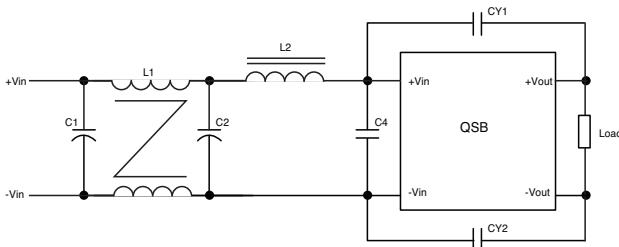

$$\Delta T = P_d \times R_{ca} = 17.6 \times 3.64 = 64^\circ\text{C}$$

Maximum case temperature is

$$T_c = T_a + \Delta T = 94^\circ\text{C} < 100^\circ\text{C}$$

Where:  $R_{ca}$  is the thermal resistance from case to ambient environment.  $T_a$  is ambient temperature and  $T_c$  is case temperature.
